

Chemistry Experiment Report

Date: 7/15/2026 | Reactions: 1

Aim

To investigate exothermic reactions by mixing Potassium and water observing the results.

Materials Used

Containers

- Beaker

Chemicals

- Potassium (K)

- Water (H₂O)

Calorimetry Data

Metal: K (Potassium)

Metal Mass: 50 g

Liquid Mass: 100 g

Equilibrium Temp: 25.0 C

Heat lost by metal: 0.0 J

Specific Heat: 0.757 J/(g.C)

Metal Temp: 25 C

Liquid Temp: 25 C

Heat gained by liquid: 0.0 J

Procedure & Observations (1 steps)

Step 1 - Beaker A

3:12:33 PM

Chemicals: Potassium (K) + Water (H₂O)

Potassium reacts violently with water, releasing hydrogen gas and heat.

Effect: explosion | Intensity: 4/10

Conclusion

In this experiment, 1 reaction were attempted. 1 produced observable results including explosion. The most vigorous reaction was $2K + 2H_2O \rightarrow 2KOH + H_2$ with an intensity of 4/10. This confirms the reactivity series and principles of chemical bonding.
