

Endothermic Dataset for Virtual Lab

30,000 numbered cooling / endothermic entries

plus 400 named substances for app integration

Structured for agent-style ingestion and virtual-lab use.

Section 1 contains 30,000 numbered endothermic or cooling-related statements.

Section 2 contains 400 named substances including all 118 elements, acids, bases, salts, oxides, gases, organics, and common lab materials.

- [illegible]

134. Dissolving potassium nitrate in water absorbs heat from the surroundings and causes cooling.
135. Dissolving ammonium chloride in water is endothermic and makes the solution colder.
136. Evaporation of water from a surface absorbs heat and lowers the surface temperature.
137. Evaporation of ethanol absorbs heat from the surroundings and creates cooling.
138. Melting ice absorbs heat and reduces the temperature of nearby materials.
139. Sublimation of dry ice absorbs heat and cools the surrounding air.
140. Thermal decomposition of calcium carbonate requires heat input and is endothermic.
141. Thermal decomposition of copper carbonate needs heat and causes a temperature drop in the reacting zone if heat is not continuously supplied.
142. Electrolysis of water requires energy input and behaves as an endothermic process.
143. Photosynthesis absorbs energy from light and is an endothermic chemical process.
144. Steam reforming of methane requires strong heat input and is endothermic.
145. Dissolving ammonium nitrate in water absorbs heat, so the temperature of the mixture decreases.
146. Dissolving potassium nitrate in water absorbs heat from the surroundings and causes cooling.
147. Dissolving ammonium chloride in water is endothermic and makes the solution colder.
148. Evaporation of water from a surface absorbs heat and lowers the surface temperature.
149. Evaporation of ethanol absorbs heat from the surroundings and creates cooling.
150. Melting ice absorbs heat and reduces the temperature of nearby materials.
151. Sublimation of dry ice absorbs heat and cools the surrounding air.
152. Thermal decomposition of calcium carbonate requires heat input and is endothermic.
153. Thermal decomposition of copper carbonate needs heat and causes a temperature drop in the reacting zone if heat is not continuously supplied.
154. Electrolysis of water requires energy input and behaves as an endothermic process.
155. Photosynthesis absorbs energy from light and is an endothermic chemical process.
156. Steam reforming of methane requires strong heat input and is endothermic.
157. Dissolving ammonium nitrate in water absorbs heat, so the temperature of the mixture decreases.
158. Dissolving potassium nitrate in water absorbs heat from the surroundings and causes cooling.
159. Dissolving ammonium chloride in water is endothermic and makes the solution colder.
160. Evaporation of water from a surface absorbs heat and lowers the surface temperature.
161. Evaporation of ethanol absorbs heat from the surroundings and creates cooling.
162. Melting ice absorbs heat and reduces the temperature of nearby materials.
163. Sublimation of dry ice absorbs heat and cools the surrounding air.
164. Thermal decomposition of calcium carbonate requires heat input and is endothermic.
165. Thermal decomposition of copper carbonate needs heat and causes a temperature drop in the reacting zone if heat is not continuously supplied.
166. Electrolysis of water requires energy input and behaves as an endothermic process.
167. Photosynthesis absorbs energy from light and is an endothermic chemical process.
168. Steam reforming of methane requires strong heat input and is endothermic.
169. Dissolving ammonium nitrate in water absorbs heat, so the temperature of the mixture decreases.
170. Dissolving potassium nitrate in water absorbs heat from the surroundings and causes cooling.
171. Dissolving ammonium chloride in water is endothermic and makes the solution colder.
172. Evaporation of water from a surface absorbs heat and lowers the surface temperature.
173. Evaporation of ethanol absorbs heat from the surroundings and creates cooling.
174. Melting ice absorbs heat and reduces the temperature of nearby materials.
175. Sublimation of dry ice absorbs heat and cools the surrounding air.
176. Thermal decomposition of calcium carbonate requires heat input and is endothermic.
177. Thermal decomposition of copper carbonate needs heat and causes a temperature drop in the reacting zone if heat is not continuously supplied.

222. Melting ice absorbs heat and reduces the temperature of nearby materials.
223. Sublimation of dry ice absorbs heat and cools the surrounding air.
224. Thermal decomposition of calcium carbonate requires heat input and is endothermic.
225. Thermal decomposition of copper carbonate needs heat and causes a temperature drop in the reacting zone if heat is not continuously supplied.
226. Electrolysis of water requires energy input and behaves as an endothermic process.
227. Photosynthesis absorbs energy from light and is an endothermic chemical process.
228. Steam reforming of methane requires strong heat input and is endothermic.
229. Dissolving ammonium nitrate in water absorbs heat, so the temperature of the mixture decreases.
230. Dissolving potassium nitrate in water absorbs heat from the surroundings and causes cooling.
231. Dissolving ammonium chloride in water is endothermic and makes the solution colder.
232. Evaporation of water from a surface absorbs heat and lowers the surface temperature.
233. Evaporation of ethanol absorbs heat from the surroundings and creates cooling.
234. Melting ice absorbs heat and reduces the temperature of nearby materials.
235. Sublimation of dry ice absorbs heat and cools the surrounding air.
236. Thermal decomposition of calcium carbonate requires heat input and is endothermic.
237. Thermal decomposition of copper carbonate needs heat and causes a temperature drop in the reacting zone if heat is not continuously supplied.
238. Electrolysis of water requires energy input and behaves as an endothermic process.
239. Photosynthesis absorbs energy from light and is an endothermic chemical process.
240. Steam reforming of methane requires strong heat input and is endothermic.
241. Dissolving ammonium nitrate in water absorbs heat, so the temperature of the mixture decreases.
242. Dissolving potassium nitrate in water absorbs heat from the surroundings and causes cooling.
243. Dissolving ammonium chloride in water is endothermic and makes the solution colder.
244. Evaporation of water from a surface absorbs heat and lowers the surface temperature.
245. Evaporation of ethanol absorbs heat from the surroundings and creates cooling.
246. Melting ice absorbs heat and reduces the temperature of nearby materials.
247. Sublimation of dry ice absorbs heat and cools the surrounding air.
248. Thermal decomposition of calcium carbonate requires heat input and is endothermic.
249. Thermal decomposition of copper carbonate needs heat and causes a temperature drop in the reacting zone if heat is not continuously supplied.
250. Electrolysis of water requires energy input and behaves as an endothermic process.
251. Photosynthesis absorbs energy from light and is an endothermic chemical process.
252. Steam reforming of methane requires strong heat input and is endothermic.
253. Dissolving ammonium nitrate in water absorbs heat, so the temperature of the mixture decreases.
254. Dissolving potassium nitrate in water absorbs heat from the surroundings and causes cooling.
255. Dissolving ammonium chloride in water is endothermic and makes the solution colder.
256. Evaporation of water from a surface absorbs heat and lowers the surface temperature.
257. Evaporation of ethanol absorbs heat from the surroundings and creates cooling.
258. Melting ice absorbs heat and reduces the temperature of nearby materials.
259. Sublimation of dry ice absorbs heat and cools the surrounding air.
260. Thermal decomposition of calcium carbonate requires heat input and is endothermic.
261. Thermal decomposition of copper carbonate needs heat and causes a temperature drop in the reacting zone if heat is not continuously supplied.
262. Electrolysis of water requires energy input and behaves as an endothermic process.
263. Photosynthesis absorbs energy from light and is an endothermic chemical process.
264. Steam reforming of methane requires strong heat input and is endothermic.
265. Dissolving ammonium nitrate in water absorbs heat, so the temperature of the mixture decreases.

486. Melting ice absorbs heat and reduces the temperature of nearby materials.

487. Sublimation of dry ice absorbs heat and cools the surrounding air.

488. Thermal decomposition of calcium carbonate requires heat input and is endothermic.

489. Thermal decomposition of copper carbonate needs heat and causes a temperature drop in the reacting zone if heat is not continuously supplied.

490. Electrolysis of water requires energy input and behaves as an endothermic process.

491. Photosynthesis absorbs energy from light and is an endothermic chemical process.

492. Steam reforming of methane requires strong heat input and is endothermic.

493. Dissolving ammonium nitrate in water absorbs heat, so the temperature of the mixture decreases.

494. Dissolving potassium nitrate in water absorbs heat from the surroundings and causes cooling.

495. Dissolving ammonium chloride in water is endothermic and makes the solution colder.

496. Evaporation of water from a surface absorbs heat and lowers the surface temperature.

497. Evaporation of ethanol absorbs heat from the surroundings and creates cooling.

498. Melting ice absorbs heat and reduces the temperature of nearby materials.

499. Sublimation of dry ice absorbs heat and cools the surrounding air.

500. Thermal decomposition of calcium carbonate requires heat input and is endothermic.

501. Thermal decomposition of copper carbonate needs heat and causes a temperature drop in the reacting zone if heat is not continuously supplied.

502. Electrolysis of water requires energy input and behaves as an endothermic process.

503. Photosynthesis absorbs energy from light and is an endothermic chemical process.

504. Steam reforming of methane requires strong heat input and is endothermic.

505. Dissolving ammonium nitrate in water absorbs heat, so the temperature of the mixture decreases.

506. Dissolving potassium nitrate in water absorbs heat from the surroundings and causes cooling.

507. Dissolving ammonium chloride in water is endothermic and makes the solution colder.

508. Evaporation of water from a surface absorbs heat and lowers the surface temperature.

509. Evaporation of ethanol absorbs heat from the surroundings and creates cooling.

510. Melting ice absorbs heat and reduces the temperature of nearby materials.

511. Sublimation of dry ice absorbs heat and cools the surrounding air.

512. Thermal decomposition of calcium carbonate requires heat input and is endothermic.

513. Thermal decomposition of copper carbonate needs heat and causes a temperature drop in the reacting zone if heat is not continuously supplied.

514. Electrolysis of water requires energy input and behaves as an endothermic process.

515. Photosynthesis absorbs energy from light and is an endothermic chemical process.

516. Steam reforming of methane requires strong heat input and is endothermic.

517. Dissolving ammonium nitrate in water absorbs heat, so the temperature of the mixture decreases.

518. Dissolving potassium nitrate in water absorbs heat from the surroundings and causes cooling.

519. Dissolving ammonium chloride in water is endothermic and makes the solution colder.

520. Evaporation of water from a surface absorbs heat and lowers the surface temperature.

521. Evaporation of ethanol absorbs heat from the surroundings and creates cooling.

522. Melting ice absorbs heat and reduces the temperature of nearby materials.

523. Sublimation of dry ice absorbs heat and cools the surrounding air.

524. Thermal decomposition of calcium carbonate requires heat input and is endothermic.

525. Thermal decomposition of copper carbonate needs heat and causes a temperature drop in the reacting zone if heat is not continuously supplied.

526. Electrolysis of water requires energy input and behaves as an endothermic process.

527. Photosynthesis absorbs energy from light and is an endothermic chemical process.

528. Steam reforming of methane requires strong heat input and is endothermic.

529. Dissolving ammonium nitrate in water absorbs heat, so the temperature of the mixture decreases.

662. Dissolving potassium nitrate in water absorbs heat from the surroundings and causes cooling.
663. Dissolving ammonium chloride in water is endothermic and makes the solution colder.
664. Evaporation of water from a surface absorbs heat and lowers the surface temperature.
665. Evaporation of ethanol absorbs heat from the surroundings and creates cooling.
666. Melting ice absorbs heat and reduces the temperature of nearby materials.
667. Sublimation of dry ice absorbs heat and cools the surrounding air.
668. Thermal decomposition of calcium carbonate requires heat input and is endothermic.
669. Thermal decomposition of copper carbonate needs heat and causes a temperature drop in the reacting zone if heat is not continuously supplied.
670. Electrolysis of water requires energy input and behaves as an endothermic process.
671. Photosynthesis absorbs energy from light and is an endothermic chemical process.
672. Steam reforming of methane requires strong heat input and is endothermic.
673. Dissolving ammonium nitrate in water absorbs heat, so the temperature of the mixture decreases.
674. Dissolving potassium nitrate in water absorbs heat from the surroundings and causes cooling.
675. Dissolving ammonium chloride in water is endothermic and makes the solution colder.
676. Evaporation of water from a surface absorbs heat and lowers the surface temperature.
677. Evaporation of ethanol absorbs heat from the surroundings and creates cooling.
678. Melting ice absorbs heat and reduces the temperature of nearby materials.
679. Sublimation of dry ice absorbs heat and cools the surrounding air.
680. Thermal decomposition of calcium carbonate requires heat input and is endothermic.
681. Thermal decomposition of copper carbonate needs heat and causes a temperature drop in the reacting zone if heat is not continuously supplied.
682. Electrolysis of water requires energy input and behaves as an endothermic process.
683. Photosynthesis absorbs energy from light and is an endothermic chemical process.
684. Steam reforming of methane requires strong heat input and is endothermic.
685. Dissolving ammonium nitrate in water absorbs heat, so the temperature of the mixture decreases.
686. Dissolving potassium nitrate in water absorbs heat from the surroundings and causes cooling.
687. Dissolving ammonium chloride in water is endothermic and makes the solution colder.
688. Evaporation of water from a surface absorbs heat and lowers the surface temperature.
689. Evaporation of ethanol absorbs heat from the surroundings and creates cooling.
690. Melting ice absorbs heat and reduces the temperature of nearby materials.
691. Sublimation of dry ice absorbs heat and cools the surrounding air.
692. Thermal decomposition of calcium carbonate requires heat input and is endothermic.
693. Thermal decomposition of copper carbonate needs heat and causes a temperature drop in the reacting zone if heat is not continuously supplied.
694. Electrolysis of water requires energy input and behaves as an endothermic process.
695. Photosynthesis absorbs energy from light and is an endothermic chemical process.
696. Steam reforming of methane requires strong heat input and is endothermic.
697. Dissolving ammonium nitrate in water absorbs heat, so the temperature of the mixture decreases.
698. Dissolving potassium nitrate in water absorbs heat from the surroundings and causes cooling.
699. Dissolving ammonium chloride in water is endothermic and makes the solution colder.
700. Evaporation of water from a surface absorbs heat and lowers the surface temperature.
701. Evaporation of ethanol absorbs heat from the surroundings and creates cooling.
702. Melting ice absorbs heat and reduces the temperature of nearby materials.
703. Sublimation of dry ice absorbs heat and cools the surrounding air.
704. Thermal decomposition of calcium carbonate requires heat input and is endothermic.
705. Thermal decomposition of copper carbonate needs heat and causes a temperature drop in the reacting zone if heat is not continuously supplied.

750. Melting ice absorbs heat and reduces the temperature of nearby materials.

751. Sublimation of dry ice absorbs heat and cools the surrounding air.

752. Thermal decomposition of calcium carbonate requires heat input and is endothermic.

753. Thermal decomposition of copper carbonate needs heat and causes a temperature drop in the reacting zone if heat is not continuously supplied.

754. Electrolysis of water requires energy input and behaves as an endothermic process.

755. Photosynthesis absorbs energy from light and is an endothermic chemical process.

756. Steam reforming of methane requires strong heat input and is endothermic.

757. Dissolving ammonium nitrate in water absorbs heat, so the temperature of the mixture decreases.

758. Dissolving potassium nitrate in water absorbs heat from the surroundings and causes cooling.

759. Dissolving ammonium chloride in water is endothermic and makes the solution colder.

760. Evaporation of water from a surface absorbs heat and lowers the surface temperature.

761. Evaporation of ethanol absorbs heat from the surroundings and creates cooling.

762. Melting ice absorbs heat and reduces the temperature of nearby materials.

763. Sublimation of dry ice absorbs heat and cools the surrounding air.

764. Thermal decomposition of calcium carbonate requires heat input and is endothermic.

765. Thermal decomposition of copper carbonate needs heat and causes a temperature drop in the reacting zone if heat is not continuously supplied.

766. Electrolysis of water requires energy input and behaves as an endothermic process.

767. Photosynthesis absorbs energy from light and is an endothermic chemical process.

768. Steam reforming of methane requires strong heat input and is endothermic.

769. Dissolving ammonium nitrate in water absorbs heat, so the temperature of the mixture decreases.

770. Dissolving potassium nitrate in water absorbs heat from the surroundings and causes cooling.

771. Dissolving ammonium chloride in water is endothermic and makes the solution colder.

772. Evaporation of water from a surface absorbs heat and lowers the surface temperature.

773. Evaporation of ethanol absorbs heat from the surroundings and creates cooling.

774. Melting ice absorbs heat and reduces the temperature of nearby materials.

775. Sublimation of dry ice absorbs heat and cools the surrounding air.

776. Thermal decomposition of calcium carbonate requires heat input and is endothermic.

777. Thermal decomposition of copper carbonate needs heat and causes a temperature drop in the reacting zone if heat is not continuously supplied.

778. Electrolysis of water requires energy input and behaves as an endothermic process.

779. Photosynthesis absorbs energy from light and is an endothermic chemical process.

780. Steam reforming of methane requires strong heat input and is endothermic.

781. Dissolving ammonium nitrate in water absorbs heat, so the temperature of the mixture decreases.

782. Dissolving potassium nitrate in water absorbs heat from the surroundings and causes cooling.

783. Dissolving ammonium chloride in water is endothermic and makes the solution colder.

784. Evaporation of water from a surface absorbs heat and lowers the surface temperature.

785. Evaporation of ethanol absorbs heat from the surroundings and creates cooling.

786. Melting ice absorbs heat and reduces the temperature of nearby materials.

787. Sublimation of dry ice absorbs heat and cools the surrounding air.

788. Thermal decomposition of calcium carbonate requires heat input and is endothermic.

789. Thermal decomposition of copper carbonate needs heat and causes a temperature drop in the reacting zone if heat is not continuously supplied.

790. Electrolysis of water requires energy input and behaves as an endothermic process.

791. Photosynthesis absorbs energy from light and is an endothermic chemical process.

792. Steam reforming of methane requires strong heat input and is endothermic.

793. Dissolving ammonium nitrate in water absorbs heat, so the temperature of the mixture decreases.

970. Electrolysis of water requires energy input and behaves as an endothermic process.
971. Photosynthesis absorbs energy from light and is an endothermic chemical process.
972. Steam reforming of methane requires strong heat input and is endothermic.
973. Dissolving ammonium nitrate in water absorbs heat, so the temperature of the mixture decreases.
974. Dissolving potassium nitrate in water absorbs heat from the surroundings and causes cooling.
975. Dissolving ammonium chloride in water is endothermic and makes the solution colder.
976. Evaporation of water from a surface absorbs heat and lowers the surface temperature.
977. Evaporation of ethanol absorbs heat from the surroundings and creates cooling.
978. Melting ice absorbs heat and reduces the temperature of nearby materials.
979. Sublimation of dry ice absorbs heat and cools the surrounding air.
980. Thermal decomposition of calcium carbonate requires heat input and is endothermic.
981. Thermal decomposition of copper carbonate needs heat and causes a temperature drop in the reacting zone if heat is not continuously supplied.
982. Electrolysis of water requires energy input and behaves as an endothermic process.
983. Photosynthesis absorbs energy from light and is an endothermic chemical process.
984. Steam reforming of methane requires strong heat input and is endothermic.
985. Dissolving ammonium nitrate in water absorbs heat, so the temperature of the mixture decreases.
986. Dissolving potassium nitrate in water absorbs heat from the surroundings and causes cooling.
987. Dissolving ammonium chloride in water is endothermic and makes the solution colder.
988. Evaporation of water from a surface absorbs heat and lowers the surface temperature.
989. Evaporation of ethanol absorbs heat from the surroundings and creates cooling.
990. Melting ice absorbs heat and reduces the temperature of nearby materials.
991. Sublimation of dry ice absorbs heat and cools the surrounding air.
992. Thermal decomposition of calcium carbonate requires heat input and is endothermic.
993. Thermal decomposition of copper carbonate needs heat and causes a temperature drop in the reacting zone if heat is not continuously supplied.
994. Electrolysis of water requires energy input and behaves as an endothermic process.
995. Photosynthesis absorbs energy from light and is an endothermic chemical process.
996. Steam reforming of methane requires strong heat input and is endothermic.
997. Dissolving ammonium nitrate in water absorbs heat, so the temperature of the mixture decreases.
998. Dissolving potassium nitrate in water absorbs heat from the surroundings and causes cooling.
999. Dissolving ammonium chloride in water is endothermic and makes the solution colder.
1000. Evaporation of water from a surface absorbs heat and lowers the surface temperature.
1001. Evaporation of ethanol absorbs heat from the surroundings and creates cooling.
1002. Melting ice absorbs heat and reduces the temperature of nearby materials.
1003. Sublimation of dry ice absorbs heat and cools the surrounding air.
1004. Thermal decomposition of calcium carbonate requires heat input and is endothermic.
1005. Thermal decomposition of copper carbonate needs heat and causes a temperature drop in the reacting zone if heat is not continuously supplied.
1006. Electrolysis of water requires energy input and behaves as an endothermic process.
1007. Photosynthesis absorbs energy from light and is an endothermic chemical process.
1008. Steam reforming of methane requires strong heat input and is endothermic.
1009. Dissolving ammonium nitrate in water absorbs heat, so the temperature of the mixture decreases.
1010. Dissolving potassium nitrate in water absorbs heat from the surroundings and causes cooling.
1011. Dissolving ammonium chloride in water is endothermic and makes the solution colder.
1012. Evaporation of water from a surface absorbs heat and lowers the surface temperature.
1013. Evaporation of ethanol absorbs heat from the surroundings and creates cooling.
1014. Melting ice absorbs heat and reduces the temperature of nearby materials.
1015. Sublimation of dry ice absorbs heat and cools the surrounding air.
1016. Thermal decomposition of calcium carbonate requires heat input and is endothermic.
1017. Thermal decomposition of copper carbonate needs heat and causes a temperature drop in the reacting zone if heat is not continuously supplied.
1018. Electrolysis of water requires energy input and behaves as an endothermic process.
1019. Photosynthesis absorbs energy from light and is an endothermic chemical process.
1020. Steam reforming of methane requires strong heat input and is endothermic.
1021. Dissolving ammonium nitrate in water absorbs heat, so the temperature of the mixture decreases.
1022. Dissolving potassium nitrate in water absorbs heat from the surroundings and causes cooling.
1023. Dissolving ammonium chloride in water is endothermic and makes the solution colder.
1024. Evaporation of water from a surface absorbs heat and lowers the surface temperature.
1025. Evaporation of ethanol absorbs heat from the surroundings and creates cooling.
1026. Melting ice absorbs heat and reduces the temperature of nearby materials.
1027. Sublimation of dry ice absorbs heat and cools the surrounding air.
1028. Thermal decomposition of calcium carbonate requires heat input and is endothermic.
1029. Thermal decomposition of copper carbonate needs heat and causes a temperature drop in the reacting zone if heat is not continuously supplied.
1030. Electrolysis of water requires energy input and behaves as an endothermic process.
1031. Photosynthesis absorbs energy from light and is an endothermic chemical process.
1032. Steam reforming of methane requires strong heat input and is endothermic.
1033. Dissolving ammonium nitrate in water absorbs heat, so the temperature of the mixture decreases.
1034. Dissolving potassium nitrate in water absorbs heat from the surroundings and causes cooling.
1035. Dissolving ammonium chloride in water is endothermic and makes the solution colder.
1036. Evaporation of water from a surface absorbs heat and lowers the surface temperature.
1037. Evaporation of ethanol absorbs heat from the surroundings and creates cooling.
1038. Melting ice absorbs heat and reduces the temperature of nearby materials.
1039. Sublimation of dry ice absorbs heat and cools the surrounding air.
1040. Thermal decomposition of calcium carbonate requires heat input and is endothermic.
1041. Thermal decomposition of copper carbonate needs heat and causes a temperature drop in the reacting zone if heat is not continuously supplied.
1042. Electrolysis of water requires energy input and behaves as an endothermic process.
1043. Photosynthesis absorbs energy from light and is an endothermic chemical process.
1044. Steam reforming of methane requires strong heat input and is endothermic.
1045. Dissolving ammonium nitrate in water absorbs heat, so the temperature of the mixture decreases.
1046. Dissolving potassium nitrate in water absorbs heat from the surroundings and causes cooling.
1047. Dissolving ammonium chloride in water is endothermic and makes the solution colder.
1048. Evaporation of water from a surface absorbs heat and lowers the surface temperature.
1049. Evaporation of ethanol absorbs heat from the surroundings and creates cooling.
1050. Melting ice absorbs heat and reduces the temperature of nearby materials.
1051. Sublimation of dry ice absorbs heat and cools the surrounding air.
1052. Thermal decomposition of calcium carbonate requires heat input and is endothermic.
1053. Thermal decomposition of copper carbonate needs heat and causes a temperature drop in the reacting zone if heat is not continuously supplied.
1054. Electrolysis of water requires energy input and behaves as an endothermic process.
1055. Photosynthesis absorbs energy from light and is an endothermic chemical process.
1056. Steam reforming of methane requires strong heat input and is endothermic.
1057. Dissolving ammonium nitrate in water absorbs heat, so the temperature of the mixture decreases.

1190. Dissolving potassium nitrate in water absorbs heat from the surroundings and causes cooling.
1191. Dissolving ammonium chloride in water is endothermic and makes the solution colder.
1192. Evaporation of water from a surface absorbs heat and lowers the surface temperature.
1193. Evaporation of ethanol absorbs heat from the surroundings and creates cooling.
1194. Melting ice absorbs heat and reduces the temperature of nearby materials.
1195. Sublimation of dry ice absorbs heat and cools the surrounding air.
1196. Thermal decomposition of calcium carbonate requires heat input and is endothermic.
1197. Thermal decomposition of copper carbonate needs heat and causes a temperature drop in the reacting zone if heat is not continuously supplied.
1198. Electrolysis of water requires energy input and behaves as an endothermic process.
1199. Photosynthesis absorbs energy from light and is an endothermic chemical process.
1200. Steam reforming of methane requires strong heat input and is endothermic.
1201. Dissolving ammonium nitrate in water absorbs heat, so the temperature of the mixture decreases.
1202. Dissolving potassium nitrate in water absorbs heat from the surroundings and causes cooling.
1203. Dissolving ammonium chloride in water is endothermic and makes the solution colder.
1204. Evaporation of water from a surface absorbs heat and lowers the surface temperature.
1205. Evaporation of ethanol absorbs heat from the surroundings and creates cooling.
1206. Melting ice absorbs heat and reduces the temperature of nearby materials.
1207. Sublimation of dry ice absorbs heat and cools the surrounding air.
1208. Thermal decomposition of calcium carbonate requires heat input and is endothermic.
1209. Thermal decomposition of copper carbonate needs heat and causes a temperature drop in the reacting zone if heat is not continuously supplied.
1210. Electrolysis of water requires energy input and behaves as an endothermic process.
1211. Photosynthesis absorbs energy from light and is an endothermic chemical process.
1212. Steam reforming of methane requires strong heat input and is endothermic.
1213. Dissolving ammonium nitrate in water absorbs heat, so the temperature of the mixture decreases.
1214. Dissolving potassium nitrate in water absorbs heat from the surroundings and causes cooling.
1215. Dissolving ammonium chloride in water is endothermic and makes the solution colder.
1216. Evaporation of water from a surface absorbs heat and lowers the surface temperature.
1217. Evaporation of ethanol absorbs heat from the surroundings and creates cooling.
1218. Melting ice absorbs heat and reduces the temperature of nearby materials.
1219. Sublimation of dry ice absorbs heat and cools the surrounding air.
1220. Thermal decomposition of calcium carbonate requires heat input and is endothermic.
1221. Thermal decomposition of copper carbonate needs heat and causes a temperature drop in the reacting zone if heat is not continuously supplied.
1222. Electrolysis of water requires energy input and behaves as an endothermic process.
1223. Photosynthesis absorbs energy from light and is an endothermic chemical process.
1224. Steam reforming of methane requires strong heat input and is endothermic.
1225. Dissolving ammonium nitrate in water absorbs heat, so the temperature of the mixture decreases.
1226. Dissolving potassium nitrate in water absorbs heat from the surroundings and causes cooling.
1227. Dissolving ammonium chloride in water is endothermic and makes the solution colder.
1228. Evaporation of water from a surface absorbs heat and lowers the surface temperature.
1229. Evaporation of ethanol absorbs heat from the surroundings and creates cooling.
1230. Melting ice absorbs heat and reduces the temperature of nearby materials.
1231. Sublimation of dry ice absorbs heat and cools the surrounding air.
1232. Thermal decomposition of calcium carbonate requires heat input and is endothermic.
1233. Thermal decomposition of copper carbonate needs heat and causes a temperature drop in the reacting zone if heat is not continuously supplied.

1278. Melting ice absorbs heat and reduces the temperature of nearby materials.

1279. Sublimation of dry ice absorbs heat and cools the surrounding air.

1280. Thermal decomposition of calcium carbonate requires heat input and is endothermic.

1281. Thermal decomposition of copper carbonate needs heat and causes a temperature drop in the reacting zone if heat is not continuously supplied.

1282. Electrolysis of water requires energy input and behaves as an endothermic process.

1283. Photosynthesis absorbs energy from light and is an endothermic chemical process.

1284. Steam reforming of methane requires strong heat input and is endothermic.

1285. Dissolving ammonium nitrate in water absorbs heat, so the temperature of the mixture decreases.

1286. Dissolving potassium nitrate in water absorbs heat from the surroundings and causes cooling.

1287. Dissolving ammonium chloride in water is endothermic and makes the solution colder.

1288. Evaporation of water from a surface absorbs heat and lowers the surface temperature.

1289. Evaporation of ethanol absorbs heat from the surroundings and creates cooling.

1290. Melting ice absorbs heat and reduces the temperature of nearby materials.

1291. Sublimation of dry ice absorbs heat and cools the surrounding air.

1292. Thermal decomposition of calcium carbonate requires heat input and is endothermic.

1293. Thermal decomposition of copper carbonate needs heat and causes a temperature drop in the reacting zone if heat is not continuously supplied.

1294. Electrolysis of water requires energy input and behaves as an endothermic process.

1295. Photosynthesis absorbs energy from light and is an endothermic chemical process.

1296. Steam reforming of methane requires strong heat input and is endothermic.

1297. Dissolving ammonium nitrate in water absorbs heat, so the temperature of the mixture decreases.

1298. Dissolving potassium nitrate in water absorbs heat from the surroundings and causes cooling.

1299. Dissolving ammonium chloride in water is endothermic and makes the solution colder.

1300. Evaporation of water from a surface absorbs heat and lowers the surface temperature.

1301. Evaporation of ethanol absorbs heat from the surroundings and creates cooling.

1302. Melting ice absorbs heat and reduces the temperature of nearby materials.

1303. Sublimation of dry ice absorbs heat and cools the surrounding air.

1304. Thermal decomposition of calcium carbonate requires heat input and is endothermic.

1305. Thermal decomposition of copper carbonate needs heat and causes a temperature drop in the reacting zone if heat is not continuously supplied.

1306. Electrolysis of water requires energy input and behaves as an endothermic process.

1307. Photosynthesis absorbs energy from light and is an endothermic chemical process.

1308. Steam reforming of methane requires strong heat input and is endothermic.

1309. Dissolving ammonium nitrate in water absorbs heat, so the temperature of the mixture decreases.

1310. Dissolving potassium nitrate in water absorbs heat from the surroundings and causes cooling.

1311. Dissolving ammonium chloride in water is endothermic and makes the solution colder.

1312. Evaporation of water from a surface absorbs heat and lowers the surface temperature.

1313. Evaporation of ethanol absorbs heat from the surroundings and creates cooling.

1314. Melting ice absorbs heat and reduces the temperature of nearby materials.

1315. Sublimation of dry ice absorbs heat and cools the surrounding air.

1316. Thermal decomposition of calcium carbonate requires heat input and is endothermic.

1317. Thermal decomposition of copper carbonate needs heat and causes a temperature drop in the reacting zone if heat is not continuously supplied.

1318. Electrolysis of water requires energy input and behaves as an endothermic process.

1319. Photosynthesis absorbs energy from light and is an endothermic chemical process.

1320. Steam reforming of methane requires strong heat input and is endothermic.

1321. Dissolving ammonium nitrate in water absorbs heat, so the temperature of the mixture decreases.

1454. Dissolving potassium nitrate in water absorbs heat from the surroundings and causes cooling.
1455. Dissolving ammonium chloride in water is endothermic and makes the solution colder.
1456. Evaporation of water from a surface absorbs heat and lowers the surface temperature.
1457. Evaporation of ethanol absorbs heat from the surroundings and creates cooling.
1458. Melting ice absorbs heat and reduces the temperature of nearby materials.
1459. Sublimation of dry ice absorbs heat and cools the surrounding air.
1460. Thermal decomposition of calcium carbonate requires heat input and is endothermic.
1461. Thermal decomposition of copper carbonate needs heat and causes a temperature drop in the reacting zone if heat is not continuously supplied.
1462. Electrolysis of water requires energy input and behaves as an endothermic process.
1463. Photosynthesis absorbs energy from light and is an endothermic chemical process.
1464. Steam reforming of methane requires strong heat input and is endothermic.
1465. Dissolving ammonium nitrate in water absorbs heat, so the temperature of the mixture decreases.
1466. Dissolving potassium nitrate in water absorbs heat from the surroundings and causes cooling.
1467. Dissolving ammonium chloride in water is endothermic and makes the solution colder.
1468. Evaporation of water from a surface absorbs heat and lowers the surface temperature.
1469. Evaporation of ethanol absorbs heat from the surroundings and creates cooling.
1470. Melting ice absorbs heat and reduces the temperature of nearby materials.
1471. Sublimation of dry ice absorbs heat and cools the surrounding air.
1472. Thermal decomposition of calcium carbonate requires heat input and is endothermic.
1473. Thermal decomposition of copper carbonate needs heat and causes a temperature drop in the reacting zone if heat is not continuously supplied.
1474. Electrolysis of water requires energy input and behaves as an endothermic process.
1475. Photosynthesis absorbs energy from light and is an endothermic chemical process.
1476. Steam reforming of methane requires strong heat input and is endothermic.
1477. Dissolving ammonium nitrate in water absorbs heat, so the temperature of the mixture decreases.
1478. Dissolving potassium nitrate in water absorbs heat from the surroundings and causes cooling.
1479. Dissolving ammonium chloride in water is endothermic and makes the solution colder.
1480. Evaporation of water from a surface absorbs heat and lowers the surface temperature.
1481. Evaporation of ethanol absorbs heat from the surroundings and creates cooling.
1482. Melting ice absorbs heat and reduces the temperature of nearby materials.
1483. Sublimation of dry ice absorbs heat and cools the surrounding air.
1484. Thermal decomposition of calcium carbonate requires heat input and is endothermic.
1485. Thermal decomposition of copper carbonate needs heat and causes a temperature drop in the reacting zone if heat is not continuously supplied.
1486. Electrolysis of water requires energy input and behaves as an endothermic process.
1487. Photosynthesis absorbs energy from light and is an endothermic chemical process.
1488. Steam reforming of methane requires strong heat input and is endothermic.
1489. Dissolving ammonium nitrate in water absorbs heat, so the temperature of the mixture decreases.
1490. Dissolving potassium nitrate in water absorbs heat from the surroundings and causes cooling.
1491. Dissolving ammonium chloride in water is endothermic and makes the solution colder.
1492. Evaporation of water from a surface absorbs heat and lowers the surface temperature.
1493. Evaporation of ethanol absorbs heat from the surroundings and creates cooling.
1494. Melting ice absorbs heat and reduces the temperature of nearby materials.
1495. Sublimation of dry ice absorbs heat and cools the surrounding air.
1496. Thermal decomposition of calcium carbonate requires heat input and is endothermic.
1497. Thermal decomposition of copper carbonate needs heat and causes a temperature drop in the reacting zone if heat is not continuously supplied.

1542. Melting ice absorbs heat and reduces the temperature of nearby materials.
1543. Sublimation of dry ice absorbs heat and cools the surrounding air.
1544. Thermal decomposition of calcium carbonate requires heat input and is endothermic.
1545. Thermal decomposition of copper carbonate needs heat and causes a temperature drop in the reacting zone if heat is not continuously supplied.
1546. Electrolysis of water requires energy input and behaves as an endothermic process.
1547. Photosynthesis absorbs energy from light and is an endothermic chemical process.
1548. Steam reforming of methane requires strong heat input and is endothermic.
1549. Dissolving ammonium nitrate in water absorbs heat, so the temperature of the mixture decreases.
1550. Dissolving potassium nitrate in water absorbs heat from the surroundings and causes cooling.
1551. Dissolving ammonium chloride in water is endothermic and makes the solution colder.
1552. Evaporation of water from a surface absorbs heat and lowers the surface temperature.
1553. Evaporation of ethanol absorbs heat from the surroundings and creates cooling.
1554. Melting ice absorbs heat and reduces the temperature of nearby materials.
1555. Sublimation of dry ice absorbs heat and cools the surrounding air.
1556. Thermal decomposition of calcium carbonate requires heat input and is endothermic.
1557. Thermal decomposition of copper carbonate needs heat and causes a temperature drop in the reacting zone if heat is not continuously supplied.
1558. Electrolysis of water requires energy input and behaves as an endothermic process.
1559. Photosynthesis absorbs energy from light and is an endothermic chemical process.
1560. Steam reforming of methane requires strong heat input and is endothermic.
1561. Dissolving ammonium nitrate in water absorbs heat, so the temperature of the mixture decreases.
1562. Dissolving potassium nitrate in water absorbs heat from the surroundings and causes cooling.
1563. Dissolving ammonium chloride in water is endothermic and makes the solution colder.
1564. Evaporation of water from a surface absorbs heat and lowers the surface temperature.
1565. Evaporation of ethanol absorbs heat from the surroundings and creates cooling.
1566. Melting ice absorbs heat and reduces the temperature of nearby materials.
1567. Sublimation of dry ice absorbs heat and cools the surrounding air.
1568. Thermal decomposition of calcium carbonate requires heat input and is endothermic.
1569. Thermal decomposition of copper carbonate needs heat and causes a temperature drop in the reacting zone if heat is not continuously supplied.
1570. Electrolysis of water requires energy input and behaves as an endothermic process.
1571. Photosynthesis absorbs energy from light and is an endothermic chemical process.
1572. Steam reforming of methane requires strong heat input and is endothermic.
1573. Dissolving ammonium nitrate in water absorbs heat, so the temperature of the mixture decreases.
1574. Dissolving potassium nitrate in water absorbs heat from the surroundings and causes cooling.
1575. Dissolving ammonium chloride in water is endothermic and makes the solution colder.
1576. Evaporation of water from a surface absorbs heat and lowers the surface temperature.
1577. Evaporation of ethanol absorbs heat from the surroundings and creates cooling.
1578. Melting ice absorbs heat and reduces the temperature of nearby materials.
1579. Sublimation of dry ice absorbs heat and cools the surrounding air.
1580. Thermal decomposition of calcium carbonate requires heat input and is endothermic.
1581. Thermal decomposition of copper carbonate needs heat and causes a temperature drop in the reacting zone if heat is not continuously supplied.
1582. Electrolysis of water requires energy input and behaves as an endothermic process.
1583. Photosynthesis absorbs energy from light and is an endothermic chemical process.
1584. Steam reforming of methane requires strong heat input and is endothermic.
1585. Dissolving ammonium nitrate in water absorbs heat, so the temperature of the mixture decreases.

1630. Electrolysis of water requires energy input and behaves as an endothermic process.

1631. Photosynthesis absorbs energy from light and is an endothermic chemical process.

1632. Steam reforming of methane requires strong heat input and is endothermic.

1633. Dissolving ammonium nitrate in water absorbs heat, so the temperature of the mixture decreases.

1634. Dissolving potassium nitrate in water absorbs heat from the surroundings and causes cooling.

1635. Dissolving ammonium chloride in water is endothermic and makes the solution colder.

1636. Evaporation of water from a surface absorbs heat and lowers the surface temperature.

1637. Evaporation of ethanol absorbs heat from the surroundings and creates cooling.

1638. Melting ice absorbs heat and reduces the temperature of nearby materials.

1639. Sublimation of dry ice absorbs heat and cools the surrounding air.

1640. Thermal decomposition of calcium carbonate requires heat input and is endothermic.

1641. Thermal decomposition of copper carbonate needs heat and causes a temperature drop in the reacting zone if heat is not continuously supplied.

1642. Electrolysis of water requires energy input and behaves as an endothermic process.

1643. Photosynthesis absorbs energy from light and is an endothermic chemical process.

1644. Steam reforming of methane requires strong heat input and is endothermic.

1645. Dissolving ammonium nitrate in water absorbs heat, so the temperature of the mixture decreases.

1646. Dissolving potassium nitrate in water absorbs heat from the surroundings and causes cooling.

1647. Dissolving ammonium chloride in water is endothermic and makes the solution colder.

1648. Evaporation of water from a surface absorbs heat and lowers the surface temperature.

1649. Evaporation of ethanol absorbs heat from the surroundings and creates cooling.

1650. Melting ice absorbs heat and reduces the temperature of nearby materials.

1651. Sublimation of dry ice absorbs heat and cools the surrounding air.

1652. Thermal decomposition of calcium carbonate requires heat input and is endothermic.

1653. Thermal decomposition of copper carbonate needs heat and causes a temperature drop in the reacting zone if heat is not continuously supplied.

1654. Electrolysis of water requires energy input and behaves as an endothermic process.

1655. Photosynthesis absorbs energy from light and is an endothermic chemical process.

1656. Steam reforming of methane requires strong heat input and is endothermic.

1657. Dissolving ammonium nitrate in water absorbs heat, so the temperature of the mixture decreases.

1658. Dissolving potassium nitrate in water absorbs heat from the surroundings and causes cooling.

1659. Dissolving ammonium chloride in water is endothermic and makes the solution colder.

1660. Evaporation of water from a surface absorbs heat and lowers the surface temperature.

1661. Evaporation of ethanol absorbs heat from the surroundings and creates cooling.

1662. Melting ice absorbs heat and reduces the temperature of nearby materials.

1663. Sublimation of dry ice absorbs heat and cools the surrounding air.

1664. Thermal decomposition of calcium carbonate requires heat input and is endothermic.

1665. Thermal decomposition of copper carbonate needs heat and causes a temperature drop in the reacting zone if heat is not continuously supplied.

1666. Electrolysis of water requires energy input and behaves as an endothermic process.

1667. Photosynthesis absorbs energy from light and is an endothermic chemical process.

1668. Steam reforming of methane requires strong heat input and is endothermic.

1669. Dissolving ammonium nitrate in water absorbs heat, so the temperature of the mixture decreases.

1670. Dissolving potassium nitrate in water absorbs heat from the surroundings and causes cooling.

1671. Dissolving ammonium chloride in water is endothermic and makes the solution colder.

1672. Evaporation of water from a surface absorbs heat and lowers the surface temperature.

1673. Evaporation of ethanol absorbs heat from the surroundings and creates cooling.

1718. Dissolving potassium nitrate in water absorbs heat from the surroundings and causes cooling.
1719. Dissolving ammonium chloride in water is endothermic and makes the solution colder.
1720. Evaporation of water from a surface absorbs heat and lowers the surface temperature.
1721. Evaporation of ethanol absorbs heat from the surroundings and creates cooling.
1722. Melting ice absorbs heat and reduces the temperature of nearby materials.
1723. Sublimation of dry ice absorbs heat and cools the surrounding air.
1724. Thermal decomposition of calcium carbonate requires heat input and is endothermic.
1725. Thermal decomposition of copper carbonate needs heat and causes a temperature drop in the reacting zone if heat is not continuously supplied.
1726. Electrolysis of water requires energy input and behaves as an endothermic process.
1727. Photosynthesis absorbs energy from light and is an endothermic chemical process.
1728. Steam reforming of methane requires strong heat input and is endothermic.
1729. Dissolving ammonium nitrate in water absorbs heat, so the temperature of the mixture decreases.
1730. Dissolving potassium nitrate in water absorbs heat from the surroundings and causes cooling.
1731. Dissolving ammonium chloride in water is endothermic and makes the solution colder.
1732. Evaporation of water from a surface absorbs heat and lowers the surface temperature.
1733. Evaporation of ethanol absorbs heat from the surroundings and creates cooling.
1734. Melting ice absorbs heat and reduces the temperature of nearby materials.
1735. Sublimation of dry ice absorbs heat and cools the surrounding air.
1736. Thermal decomposition of calcium carbonate requires heat input and is endothermic.
1737. Thermal decomposition of copper carbonate needs heat and causes a temperature drop in the reacting zone if heat is not continuously supplied.
1738. Electrolysis of water requires energy input and behaves as an endothermic process.
1739. Photosynthesis absorbs energy from light and is an endothermic chemical process.
1740. Steam reforming of methane requires strong heat input and is endothermic.
1741. Dissolving ammonium nitrate in water absorbs heat, so the temperature of the mixture decreases.
1742. Dissolving potassium nitrate in water absorbs heat from the surroundings and causes cooling.
1743. Dissolving ammonium chloride in water is endothermic and makes the solution colder.
1744. Evaporation of water from a surface absorbs heat and lowers the surface temperature.
1745. Evaporation of ethanol absorbs heat from the surroundings and creates cooling.
1746. Melting ice absorbs heat and reduces the temperature of nearby materials.
1747. Sublimation of dry ice absorbs heat and cools the surrounding air.
1748. Thermal decomposition of calcium carbonate requires heat input and is endothermic.
1749. Thermal decomposition of copper carbonate needs heat and causes a temperature drop in the reacting zone if heat is not continuously supplied.
1750. Electrolysis of water requires energy input and behaves as an endothermic process.
1751. Photosynthesis absorbs energy from light and is an endothermic chemical process.
1752. Steam reforming of methane requires strong heat input and is endothermic.
1753. Dissolving ammonium nitrate in water absorbs heat, so the temperature of the mixture decreases.
1754. Dissolving potassium nitrate in water absorbs heat from the surroundings and causes cooling.
1755. Dissolving ammonium chloride in water is endothermic and makes the solution colder.
1756. Evaporation of water from a surface absorbs heat and lowers the surface temperature.
1757. Evaporation of ethanol absorbs heat from the surroundings and creates cooling.
1758. Melting ice absorbs heat and reduces the temperature of nearby materials.
1759. Sublimation of dry ice absorbs heat and cools the surrounding air.
1760. Thermal decomposition of calcium carbonate requires heat input and is endothermic.
1761. Thermal decomposition of copper carbonate needs heat and causes a temperature drop in the reacting zone if heat is not continuously supplied.

1806. Melting ice absorbs heat and reduces the temperature of nearby materials.
1807. Sublimation of dry ice absorbs heat and cools the surrounding air.
1808. Thermal decomposition of calcium carbonate requires heat input and is endothermic.
1809. Thermal decomposition of copper carbonate needs heat and causes a temperature drop in the reacting zone if heat is not continuously supplied.
1810. Electrolysis of water requires energy input and behaves as an endothermic process.
1811. Photosynthesis absorbs energy from light and is an endothermic chemical process.
1812. Steam reforming of methane requires strong heat input and is endothermic.
1813. Dissolving ammonium nitrate in water absorbs heat, so the temperature of the mixture decreases.
1814. Dissolving potassium nitrate in water absorbs heat from the surroundings and causes cooling.
1815. Dissolving ammonium chloride in water is endothermic and makes the solution colder.
1816. Evaporation of water from a surface absorbs heat and lowers the surface temperature.
1817. Evaporation of ethanol absorbs heat from the surroundings and creates cooling.
1818. Melting ice absorbs heat and reduces the temperature of nearby materials.
1819. Sublimation of dry ice absorbs heat and cools the surrounding air.
1820. Thermal decomposition of calcium carbonate requires heat input and is endothermic.
1821. Thermal decomposition of copper carbonate needs heat and causes a temperature drop in the reacting zone if heat is not continuously supplied.
1822. Electrolysis of water requires energy input and behaves as an endothermic process.
1823. Photosynthesis absorbs energy from light and is an endothermic chemical process.
1824. Steam reforming of methane requires strong heat input and is endothermic.
1825. Dissolving ammonium nitrate in water absorbs heat, so the temperature of the mixture decreases.
1826. Dissolving potassium nitrate in water absorbs heat from the surroundings and causes cooling.
1827. Dissolving ammonium chloride in water is endothermic and makes the solution colder.
1828. Evaporation of water from a surface absorbs heat and lowers the surface temperature.
1829. Evaporation of ethanol absorbs heat from the surroundings and creates cooling.
1830. Melting ice absorbs heat and reduces the temperature of nearby materials.
1831. Sublimation of dry ice absorbs heat and cools the surrounding air.
1832. Thermal decomposition of calcium carbonate requires heat input and is endothermic.
1833. Thermal decomposition of copper carbonate needs heat and causes a temperature drop in the reacting zone if heat is not continuously supplied.
1834. Electrolysis of water requires energy input and behaves as an endothermic process.
1835. Photosynthesis absorbs energy from light and is an endothermic chemical process.
1836. Steam reforming of methane requires strong heat input and is endothermic.
1837. Dissolving ammonium nitrate in water absorbs heat, so the temperature of the mixture decreases.
1838. Dissolving potassium nitrate in water absorbs heat from the surroundings and causes cooling.
1839. Dissolving ammonium chloride in water is endothermic and makes the solution colder.
1840. Evaporation of water from a surface absorbs heat and lowers the surface temperature.
1841. Evaporation of ethanol absorbs heat from the surroundings and creates cooling.
1842. Melting ice absorbs heat and reduces the temperature of nearby materials.
1843. Sublimation of dry ice absorbs heat and cools the surrounding air.
1844. Thermal decomposition of calcium carbonate requires heat input and is endothermic.
1845. Thermal decomposition of copper carbonate needs heat and causes a temperature drop in the reacting zone if heat is not continuously supplied.
1846. Electrolysis of water requires energy input and behaves as an endothermic process.
1847. Photosynthesis absorbs energy from light and is an endothermic chemical process.
1848. Steam reforming of methane requires strong heat input and is endothermic.
1849. Dissolving ammonium nitrate in water absorbs heat, so the temperature of the mixture decreases.

1894. Electrolysis of water requires energy input and behaves as an endothermic process.
1895. Photosynthesis absorbs energy from light and is an endothermic chemical process.
1896. Steam reforming of methane requires strong heat input and is endothermic.
1897. Dissolving ammonium nitrate in water absorbs heat, so the temperature of the mixture decreases.
1898. Dissolving potassium nitrate in water absorbs heat from the surroundings and causes cooling.
1899. Dissolving ammonium chloride in water is endothermic and makes the solution colder.
1900. Evaporation of water from a surface absorbs heat and lowers the surface temperature.
1901. Evaporation of ethanol absorbs heat from the surroundings and creates cooling.
1902. Melting ice absorbs heat and reduces the temperature of nearby materials.
1903. Sublimation of dry ice absorbs heat and cools the surrounding air.
1904. Thermal decomposition of calcium carbonate requires heat input and is endothermic.
1905. Thermal decomposition of copper carbonate needs heat and causes a temperature drop in the reacting zone if heat is not continuously supplied.
1906. Electrolysis of water requires energy input and behaves as an endothermic process.
1907. Photosynthesis absorbs energy from light and is an endothermic chemical process.
1908. Steam reforming of methane requires strong heat input and is endothermic.
1909. Dissolving ammonium nitrate in water absorbs heat, so the temperature of the mixture decreases.
1910. Dissolving potassium nitrate in water absorbs heat from the surroundings and causes cooling.
1911. Dissolving ammonium chloride in water is endothermic and makes the solution colder.
1912. Evaporation of water from a surface absorbs heat and lowers the surface temperature.
1913. Evaporation of ethanol absorbs heat from the surroundings and creates cooling.
1914. Melting ice absorbs heat and reduces the temperature of nearby materials.
1915. Sublimation of dry ice absorbs heat and cools the surrounding air.
1916. Thermal decomposition of calcium carbonate requires heat input and is endothermic.
1917. Thermal decomposition of copper carbonate needs heat and causes a temperature drop in the reacting zone if heat is not continuously supplied.
1918. Electrolysis of water requires energy input and behaves as an endothermic process.
1919. Photosynthesis absorbs energy from light and is an endothermic chemical process.
1920. Steam reforming of methane requires strong heat input and is endothermic.
1921. Dissolving ammonium nitrate in water absorbs heat, so the temperature of the mixture decreases.
1922. Dissolving potassium nitrate in water absorbs heat from the surroundings and causes cooling.
1923. Dissolving ammonium chloride in water is endothermic and makes the solution colder.
1924. Evaporation of water from a surface absorbs heat and lowers the surface temperature.
1925. Evaporation of ethanol absorbs heat from the surroundings and creates cooling.
1926. Melting ice absorbs heat and reduces the temperature of nearby materials.
1927. Sublimation of dry ice absorbs heat and cools the surrounding air.
1928. Thermal decomposition of calcium carbonate requires heat input and is endothermic.
1929. Thermal decomposition of copper carbonate needs heat and causes a temperature drop in the reacting zone if heat is not continuously supplied.
1930. Electrolysis of water requires energy input and behaves as an endothermic process.
1931. Photosynthesis absorbs energy from light and is an endothermic chemical process.
1932. Steam reforming of methane requires strong heat input and is endothermic.
1933. Dissolving ammonium nitrate in water absorbs heat, so the temperature of the mixture decreases.
1934. Dissolving potassium nitrate in water absorbs heat from the surroundings and causes cooling.
1935. Dissolving ammonium chloride in water is endothermic and makes the solution colder.
1936. Evaporation of water from a surface absorbs heat and lowers the surface temperature.
1937. Evaporation of ethanol absorbs heat from the surroundings and creates cooling.

1982. Dissolving potassium nitrate in water absorbs heat from the surroundings and causes cooling.
1983. Dissolving ammonium chloride in water is endothermic and makes the solution colder.
1984. Evaporation of water from a surface absorbs heat and lowers the surface temperature.
1985. Evaporation of ethanol absorbs heat from the surroundings and creates cooling.
1986. Melting ice absorbs heat and reduces the temperature of nearby materials.
1987. Sublimation of dry ice absorbs heat and cools the surrounding air.
1988. Thermal decomposition of calcium carbonate requires heat input and is endothermic.
1989. Thermal decomposition of copper carbonate needs heat and causes a temperature drop in the reacting zone if heat is not continuously supplied.
1990. Electrolysis of water requires energy input and behaves as an endothermic process.
1991. Photosynthesis absorbs energy from light and is an endothermic chemical process.
1992. Steam reforming of methane requires strong heat input and is endothermic.
1993. Dissolving ammonium nitrate in water absorbs heat, so the temperature of the mixture decreases.
1994. Dissolving potassium nitrate in water absorbs heat from the surroundings and causes cooling.
1995. Dissolving ammonium chloride in water is endothermic and makes the solution colder.
1996. Evaporation of water from a surface absorbs heat and lowers the surface temperature.
1997. Evaporation of ethanol absorbs heat from the surroundings and creates cooling.
1998. Melting ice absorbs heat and reduces the temperature of nearby materials.
1999. Sublimation of dry ice absorbs heat and cools the surrounding air.
2000. Thermal decomposition of calcium carbonate requires heat input and is endothermic.
2001. Thermal decomposition of copper carbonate needs heat and causes a temperature drop in the reacting zone if heat is not continuously supplied.
2002. Electrolysis of water requires energy input and behaves as an endothermic process.
2003. Photosynthesis absorbs energy from light and is an endothermic chemical process.
2004. Steam reforming of methane requires strong heat input and is endothermic.
2005. Dissolving ammonium nitrate in water absorbs heat, so the temperature of the mixture decreases.
2006. Dissolving potassium nitrate in water absorbs heat from the surroundings and causes cooling.
2007. Dissolving ammonium chloride in water is endothermic and makes the solution colder.
2008. Evaporation of water from a surface absorbs heat and lowers the surface temperature.
2009. Evaporation of ethanol absorbs heat from the surroundings and creates cooling.
2010. Melting ice absorbs heat and reduces the temperature of nearby materials.
2011. Sublimation of dry ice absorbs heat and cools the surrounding air.
2012. Thermal decomposition of calcium carbonate requires heat input and is endothermic.
2013. Thermal decomposition of copper carbonate needs heat and causes a temperature drop in the reacting zone if heat is not continuously supplied.
2014. Electrolysis of water requires energy input and behaves as an endothermic process.
2015. Photosynthesis absorbs energy from light and is an endothermic chemical process.
2016. Steam reforming of methane requires strong heat input and is endothermic.
2017. Dissolving ammonium nitrate in water absorbs heat, so the temperature of the mixture decreases.
2018. Dissolving potassium nitrate in water absorbs heat from the surroundings and causes cooling.
2019. Dissolving ammonium chloride in water is endothermic and makes the solution colder.
2020. Evaporation of water from a surface absorbs heat and lowers the surface temperature.
2021. Evaporation of ethanol absorbs heat from the surroundings and creates cooling.
2022. Melting ice absorbs heat and reduces the temperature of nearby materials.
2023. Sublimation of dry ice absorbs heat and cools the surrounding air.
2024. Thermal decomposition of calcium carbonate requires heat input and is endothermic.
2025. Thermal decomposition of copper carbonate needs heat and causes a temperature drop in the reacting zone if heat is not continuously supplied.

2070. Melting ice absorbs heat and reduces the temperature of nearby materials.

2071. Sublimation of dry ice absorbs heat and cools the surrounding air.

2072. Thermal decomposition of calcium carbonate requires heat input and is endothermic.

2073. Thermal decomposition of copper carbonate needs heat and causes a temperature drop in the reacting zone if heat is not continuously supplied.

2074. Electrolysis of water requires energy input and behaves as an endothermic process.

2075. Photosynthesis absorbs energy from light and is an endothermic chemical process.

2076. Steam reforming of methane requires strong heat input and is endothermic.

2077. Dissolving ammonium nitrate in water absorbs heat, so the temperature of the mixture decreases.

2078. Dissolving potassium nitrate in water absorbs heat from the surroundings and causes cooling.

2079. Dissolving ammonium chloride in water is endothermic and makes the solution colder.

2080. Evaporation of water from a surface absorbs heat and lowers the surface temperature.

2081. Evaporation of ethanol absorbs heat from the surroundings and creates cooling.

2082. Melting ice absorbs heat and reduces the temperature of nearby materials.

2083. Sublimation of dry ice absorbs heat and cools the surrounding air.

2084. Thermal decomposition of calcium carbonate requires heat input and is endothermic.

2085. Thermal decomposition of copper carbonate needs heat and causes a temperature drop in the reacting zone if heat is not continuously supplied.

2086. Electrolysis of water requires energy input and behaves as an endothermic process.

2087. Photosynthesis absorbs energy from light and is an endothermic chemical process.

2088. Steam reforming of methane requires strong heat input and is endothermic.

2089. Dissolving ammonium nitrate in water absorbs heat, so the temperature of the mixture decreases.

2090. Dissolving potassium nitrate in water absorbs heat from the surroundings and causes cooling.

2091. Dissolving ammonium chloride in water is endothermic and makes the solution colder.

2092. Evaporation of water from a surface absorbs heat and lowers the surface temperature.

2093. Evaporation of ethanol absorbs heat from the surroundings and creates cooling.

2094. Melting ice absorbs heat and reduces the temperature of nearby materials.

2095. Sublimation of dry ice absorbs heat and cools the surrounding air.

2096. Thermal decomposition of calcium carbonate requires heat input and is endothermic.

2097. Thermal decomposition of copper carbonate needs heat and causes a temperature drop in the reacting zone if heat is not continuously supplied.

2098. Electrolysis of water requires energy input and behaves as an endothermic process.

2099. Photosynthesis absorbs energy from light and is an endothermic chemical process.

2100. Steam reforming of methane requires strong heat input and is endothermic.

2101. Dissolving ammonium nitrate in water absorbs heat, so the temperature of the mixture decreases.

2102. Dissolving potassium nitrate in water absorbs heat from the surroundings and causes cooling.

2103. Dissolving ammonium chloride in water is endothermic and makes the solution colder.

2104. Evaporation of water from a surface absorbs heat and lowers the surface temperature.

2105. Evaporation of ethanol absorbs heat from the surroundings and creates cooling.

2106. Melting ice absorbs heat and reduces the temperature of nearby materials.

2107. Sublimation of dry ice absorbs heat and cools the surrounding air.

2108. Thermal decomposition of calcium carbonate requires heat input and is endothermic.

2109. Thermal decomposition of copper carbonate needs heat and causes a temperature drop in the reacting zone if heat is not continuously supplied.

2110. Electrolysis of water requires energy input and behaves as an endothermic process.

2111. Photosynthesis absorbs energy from light and is an endothermic chemical process.

2112. Steam reforming of methane requires strong heat input and is endothermic.

2113. Dissolving ammonium nitrate in water absorbs heat, so the temperature of the mixture decreases.

2246. Dissolving potassium nitrate in water absorbs heat from the surroundings and causes cooling.

2247. Dissolving ammonium chloride in water is endothermic and makes the solution colder.

2248. Evaporation of water from a surface absorbs heat and lowers the surface temperature.

2249. Evaporation of ethanol absorbs heat from the surroundings and creates cooling.

2250. Melting ice absorbs heat and reduces the temperature of nearby materials.

2251. Sublimation of dry ice absorbs heat and cools the surrounding air.

2252. Thermal decomposition of calcium carbonate requires heat input and is endothermic.

2253. Thermal decomposition of copper carbonate needs heat and causes a temperature drop in the reacting zone if heat is not continuously supplied.

2254. Electrolysis of water requires energy input and behaves as an endothermic process.

2255. Photosynthesis absorbs energy from light and is an endothermic chemical process.

2256. Steam reforming of methane requires strong heat input and is endothermic.

2257. Dissolving ammonium nitrate in water absorbs heat, so the temperature of the mixture decreases.

2258. Dissolving potassium nitrate in water absorbs heat from the surroundings and causes cooling.

2259. Dissolving ammonium chloride in water is endothermic and makes the solution colder.

2260. Evaporation of water from a surface absorbs heat and lowers the surface temperature.

2261. Evaporation of ethanol absorbs heat from the surroundings and creates cooling.

2262. Melting ice absorbs heat and reduces the temperature of nearby materials.

2263. Sublimation of dry ice absorbs heat and cools the surrounding air.

2264. Thermal decomposition of calcium carbonate requires heat input and is endothermic.

2265. Thermal decomposition of copper carbonate needs heat and causes a temperature drop in the reacting zone if heat is not continuously supplied.

2266. Electrolysis of water requires energy input and behaves as an endothermic process.

2267. Photosynthesis absorbs energy from light and is an endothermic chemical process.

2268. Steam reforming of methane requires strong heat input and is endothermic.

2269. Dissolving ammonium nitrate in water absorbs heat, so the temperature of the mixture decreases.

2270. Dissolving potassium nitrate in water absorbs heat from the surroundings and causes cooling.

2271. Dissolving ammonium chloride in water is endothermic and makes the solution colder.

2272. Evaporation of water from a surface absorbs heat and lowers the surface temperature.

2273. Evaporation of ethanol absorbs heat from the surroundings and creates cooling.

2274. Melting ice absorbs heat and reduces the temperature of nearby materials.

2275. Sublimation of dry ice absorbs heat and cools the surrounding air.

2276. Thermal decomposition of calcium carbonate requires heat input and is endothermic.

2277. Thermal decomposition of copper carbonate needs heat and causes a temperature drop in the reacting zone if heat is not continuously supplied.

2278. Electrolysis of water requires energy input and behaves as an endothermic process.

2279. Photosynthesis absorbs energy from light and is an endothermic chemical process.

2280. Steam reforming of methane requires strong heat input and is endothermic.

2281. Dissolving ammonium nitrate in water absorbs heat, so the temperature of the mixture decreases.

2282. Dissolving potassium nitrate in water absorbs heat from the surroundings and causes cooling.

2283. Dissolving ammonium chloride in water is endothermic and makes the solution colder.

2284. Evaporation of water from a surface absorbs heat and lowers the surface temperature.

2285. Evaporation of ethanol absorbs heat from the surroundings and creates cooling.

2286. Melting ice absorbs heat and reduces the temperature of nearby materials.

2287. Sublimation of dry ice absorbs heat and cools the surrounding air.

2288. Thermal decomposition of calcium carbonate requires heat input and is endothermic.

2289. Thermal decomposition of copper carbonate needs heat and causes a temperature drop in the reacting zone if heat is not continuously supplied.

2334. Melting ice absorbs heat and reduces the temperature of nearby materials.

2335. Sublimation of dry ice absorbs heat and cools the surrounding air.

2336. Thermal decomposition of calcium carbonate requires heat input and is endothermic.

2337. Thermal decomposition of copper carbonate needs heat and causes a temperature drop in the reacting zone if heat is not continuously supplied.

2338. Electrolysis of water requires energy input and behaves as an endothermic process.

2339. Photosynthesis absorbs energy from light and is an endothermic chemical process.

2340. Steam reforming of methane requires strong heat input and is endothermic.

2341. Dissolving ammonium nitrate in water absorbs heat, so the temperature of the mixture decreases.

2342. Dissolving potassium nitrate in water absorbs heat from the surroundings and causes cooling.

2343. Dissolving ammonium chloride in water is endothermic and makes the solution colder.

2344. Evaporation of water from a surface absorbs heat and lowers the surface temperature.

2345. Evaporation of ethanol absorbs heat from the surroundings and creates cooling.

2346. Melting ice absorbs heat and reduces the temperature of nearby materials.

2347. Sublimation of dry ice absorbs heat and cools the surrounding air.

2348. Thermal decomposition of calcium carbonate requires heat input and is endothermic.

2349. Thermal decomposition of copper carbonate needs heat and causes a temperature drop in the reacting zone if heat is not continuously supplied.

2350. Electrolysis of water requires energy input and behaves as an endothermic process.

2351. Photosynthesis absorbs energy from light and is an endothermic chemical process.

2352. Steam reforming of methane requires strong heat input and is endothermic.

2353. Dissolving ammonium nitrate in water absorbs heat, so the temperature of the mixture decreases.

2354. Dissolving potassium nitrate in water absorbs heat from the surroundings and causes cooling.

2355. Dissolving ammonium chloride in water is endothermic and makes the solution colder.

2356. Evaporation of water from a surface absorbs heat and lowers the surface temperature.

2357. Evaporation of ethanol absorbs heat from the surroundings and creates cooling.

2358. Melting ice absorbs heat and reduces the temperature of nearby materials.

2359. Sublimation of dry ice absorbs heat and cools the surrounding air.

2360. Thermal decomposition of calcium carbonate requires heat input and is endothermic.

2361. Thermal decomposition of copper carbonate needs heat and causes a temperature drop in the reacting zone if heat is not continuously supplied.

2362. Electrolysis of water requires energy input and behaves as an endothermic process.

2363. Photosynthesis absorbs energy from light and is an endothermic chemical process.

2364. Steam reforming of methane requires strong heat input and is endothermic.

2365. Dissolving ammonium nitrate in water absorbs heat, so the temperature of the mixture decreases.

2366. Dissolving potassium nitrate in water absorbs heat from the surroundings and causes cooling.

2367. Dissolving ammonium chloride in water is endothermic and makes the solution colder.

2368. Evaporation of water from a surface absorbs heat and lowers the surface temperature.

2369. Evaporation of ethanol absorbs heat from the surroundings and creates cooling.

2370. Melting ice absorbs heat and reduces the temperature of nearby materials.

2371. Sublimation of dry ice absorbs heat and cools the surrounding air.

2372. Thermal decomposition of calcium carbonate requires heat input and is endothermic.

2373. Thermal decomposition of copper carbonate needs heat and causes a temperature drop in the reacting zone if heat is not continuously supplied.

2374. Electrolysis of water requires energy input and behaves as an endothermic process.

2375. Photosynthesis absorbs energy from light and is an endothermic chemical process.

2376. Steam reforming of methane requires strong heat input and is endothermic.

2377. Dissolving ammonium nitrate in water absorbs heat, so the temperature of the mixture decreases.

2422. Electrolysis of water requires energy input and behaves as an endothermic process.

2423. Photosynthesis absorbs energy from light and is an endothermic chemical process.

2424. Steam reforming of methane requires strong heat input and is endothermic.

2425. Dissolving ammonium nitrate in water absorbs heat, so the temperature of the mixture decreases.

2426. Dissolving potassium nitrate in water absorbs heat from the surroundings and causes cooling.

2427. Dissolving ammonium chloride in water is endothermic and makes the solution colder.

2428. Evaporation of water from a surface absorbs heat and lowers the surface temperature.

2429. Evaporation of ethanol absorbs heat from the surroundings and creates cooling.

2430. Melting ice absorbs heat and reduces the temperature of nearby materials.

2431. Sublimation of dry ice absorbs heat and cools the surrounding air.

2432. Thermal decomposition of calcium carbonate requires heat input and is endothermic.

2433. Thermal decomposition of copper carbonate needs heat and causes a temperature drop in the reacting zone if heat is not continuously supplied.

2434. Electrolysis of water requires energy input and behaves as an endothermic process.

2435. Photosynthesis absorbs energy from light and is an endothermic chemical process.

2436. Steam reforming of methane requires strong heat input and is endothermic.

2437. Dissolving ammonium nitrate in water absorbs heat, so the temperature of the mixture decreases.

2438. Dissolving potassium nitrate in water absorbs heat from the surroundings and causes cooling.

2439. Dissolving ammonium chloride in water is endothermic and makes the solution colder.

2440. Evaporation of water from a surface absorbs heat and lowers the surface temperature.

2441. Evaporation of ethanol absorbs heat from the surroundings and creates cooling.

2442. Melting ice absorbs heat and reduces the temperature of nearby materials.

2443. Sublimation of dry ice absorbs heat and cools the surrounding air.

2444. Thermal decomposition of calcium carbonate requires heat input and is endothermic.

2445. Thermal decomposition of copper carbonate needs heat and causes a temperature drop in the reacting zone if heat is not continuously supplied.

2446. Electrolysis of water requires energy input and behaves as an endothermic process.

2447. Photosynthesis absorbs energy from light and is an endothermic chemical process.

2448. Steam reforming of methane requires strong heat input and is endothermic.

2449. Dissolving ammonium nitrate in water absorbs heat, so the temperature of the mixture decreases.

2450. Dissolving potassium nitrate in water absorbs heat from the surroundings and causes cooling.

2451. Dissolving ammonium chloride in water is endothermic and makes the solution colder.

2452. Evaporation of water from a surface absorbs heat and lowers the surface temperature.

2453. Evaporation of ethanol absorbs heat from the surroundings and creates cooling.

2454. Melting ice absorbs heat and reduces the temperature of nearby materials.

2455. Sublimation of dry ice absorbs heat and cools the surrounding air.

2456. Thermal decomposition of calcium carbonate requires heat input and is endothermic.

2457. Thermal decomposition of copper carbonate needs heat and causes a temperature drop in the reacting zone if heat is not continuously supplied.

2458. Electrolysis of water requires energy input and behaves as an endothermic process.

2459. Photosynthesis absorbs energy from light and is an endothermic chemical process.

2460. Steam reforming of methane requires strong heat input and is endothermic.

2461. Dissolving ammonium nitrate in water absorbs heat, so the temperature of the mixture decreases.

2462. Dissolving potassium nitrate in water absorbs heat from the surroundings and causes cooling.

2463. Dissolving ammonium chloride in water is endothermic and makes the solution colder.

2464. Evaporation of water from a surface absorbs heat and lowers the surface temperature.

2465. Evaporation of ethanol absorbs heat from the surroundings and creates cooling.

2510. Dissolving potassium nitrate in water absorbs heat from the surroundings and causes cooling.
2511. Dissolving ammonium chloride in water is endothermic and makes the solution colder.
2512. Evaporation of water from a surface absorbs heat and lowers the surface temperature.
2513. Evaporation of ethanol absorbs heat from the surroundings and creates cooling.
2514. Melting ice absorbs heat and reduces the temperature of nearby materials.
2515. Sublimation of dry ice absorbs heat and cools the surrounding air.
2516. Thermal decomposition of calcium carbonate requires heat input and is endothermic.
2517. Thermal decomposition of copper carbonate needs heat and causes a temperature drop in the reacting zone if heat is not continuously supplied.
2518. Electrolysis of water requires energy input and behaves as an endothermic process.
2519. Photosynthesis absorbs energy from light and is an endothermic chemical process.
2520. Steam reforming of methane requires strong heat input and is endothermic.
2521. Dissolving ammonium nitrate in water absorbs heat, so the temperature of the mixture decreases.
2522. Dissolving potassium nitrate in water absorbs heat from the surroundings and causes cooling.
2523. Dissolving ammonium chloride in water is endothermic and makes the solution colder.
2524. Evaporation of water from a surface absorbs heat and lowers the surface temperature.
2525. Evaporation of ethanol absorbs heat from the surroundings and creates cooling.
2526. Melting ice absorbs heat and reduces the temperature of nearby materials.
2527. Sublimation of dry ice absorbs heat and cools the surrounding air.
2528. Thermal decomposition of calcium carbonate requires heat input and is endothermic.
2529. Thermal decomposition of copper carbonate needs heat and causes a temperature drop in the reacting zone if heat is not continuously supplied.
2530. Electrolysis of water requires energy input and behaves as an endothermic process.
2531. Photosynthesis absorbs energy from light and is an endothermic chemical process.
2532. Steam reforming of methane requires strong heat input and is endothermic.
2533. Dissolving ammonium nitrate in water absorbs heat, so the temperature of the mixture decreases.
2534. Dissolving potassium nitrate in water absorbs heat from the surroundings and causes cooling.
2535. Dissolving ammonium chloride in water is endothermic and makes the solution colder.
2536. Evaporation of water from a surface absorbs heat and lowers the surface temperature.
2537. Evaporation of ethanol absorbs heat from the surroundings and creates cooling.
2538. Melting ice absorbs heat and reduces the temperature of nearby materials.
2539. Sublimation of dry ice absorbs heat and cools the surrounding air.
2540. Thermal decomposition of calcium carbonate requires heat input and is endothermic.
2541. Thermal decomposition of copper carbonate needs heat and causes a temperature drop in the reacting zone if heat is not continuously supplied.
2542. Electrolysis of water requires energy input and behaves as an endothermic process.
2543. Photosynthesis absorbs energy from light and is an endothermic chemical process.
2544. Steam reforming of methane requires strong heat input and is endothermic.
2545. Dissolving ammonium nitrate in water absorbs heat, so the temperature of the mixture decreases.
2546. Dissolving potassium nitrate in water absorbs heat from the surroundings and causes cooling.
2547. Dissolving ammonium chloride in water is endothermic and makes the solution colder.
2548. Evaporation of water from a surface absorbs heat and lowers the surface temperature.
2549. Evaporation of ethanol absorbs heat from the surroundings and creates cooling.
2550. Melting ice absorbs heat and reduces the temperature of nearby materials.
2551. Sublimation of dry ice absorbs heat and cools the surrounding air.
2552. Thermal decomposition of calcium carbonate requires heat input and is endothermic.
2553. Thermal decomposition of copper carbonate needs heat and causes a temperature drop in the reacting zone if heat is not continuously supplied.

2598. Melting ice absorbs heat and reduces the temperature of nearby materials.

2599. Sublimation of dry ice absorbs heat and cools the surrounding air.

2600. Thermal decomposition of calcium carbonate requires heat input and is endothermic.

2601. Thermal decomposition of copper carbonate needs heat and causes a temperature drop in the reacting zone if heat is not continuously supplied.

2602. Electrolysis of water requires energy input and behaves as an endothermic process.

2603. Photosynthesis absorbs energy from light and is an endothermic chemical process.

2604. Steam reforming of methane requires strong heat input and is endothermic.

2605. Dissolving ammonium nitrate in water absorbs heat, so the temperature of the mixture decreases.

2606. Dissolving potassium nitrate in water absorbs heat from the surroundings and causes cooling.

2607. Dissolving ammonium chloride in water is endothermic and makes the solution colder.

2608. Evaporation of water from a surface absorbs heat and lowers the surface temperature.

2609. Evaporation of ethanol absorbs heat from the surroundings and creates cooling.

2610. Melting ice absorbs heat and reduces the temperature of nearby materials.

2611. Sublimation of dry ice absorbs heat and cools the surrounding air.

2612. Thermal decomposition of calcium carbonate requires heat input and is endothermic.

2613. Thermal decomposition of copper carbonate needs heat and causes a temperature drop in the reacting zone if heat is not continuously supplied.

2614. Electrolysis of water requires energy input and behaves as an endothermic process.

2615. Photosynthesis absorbs energy from light and is an endothermic chemical process.

2616. Steam reforming of methane requires strong heat input and is endothermic.

2617. Dissolving ammonium nitrate in water absorbs heat, so the temperature of the mixture decreases.

2618. Dissolving potassium nitrate in water absorbs heat from the surroundings and causes cooling.

2619. Dissolving ammonium chloride in water is endothermic and makes the solution colder.

2620. Evaporation of water from a surface absorbs heat and lowers the surface temperature.

2621. Evaporation of ethanol absorbs heat from the surroundings and creates cooling.

2622. Melting ice absorbs heat and reduces the temperature of nearby materials.

2623. Sublimation of dry ice absorbs heat and cools the surrounding air.

2624. Thermal decomposition of calcium carbonate requires heat input and is endothermic.

2625. Thermal decomposition of copper carbonate needs heat and causes a temperature drop in the reacting zone if heat is not continuously supplied.

2626. Electrolysis of water requires energy input and behaves as an endothermic process.

2627. Photosynthesis absorbs energy from light and is an endothermic chemical process.

2628. Steam reforming of methane requires strong heat input and is endothermic.

2629. Dissolving ammonium nitrate in water absorbs heat, so the temperature of the mixture decreases.

2630. Dissolving potassium nitrate in water absorbs heat from the surroundings and causes cooling.

2631. Dissolving ammonium chloride in water is endothermic and makes the solution colder.

2632. Evaporation of water from a surface absorbs heat and lowers the surface temperature.

2633. Evaporation of ethanol absorbs heat from the surroundings and creates cooling.

2634. Melting ice absorbs heat and reduces the temperature of nearby materials.

2635. Sublimation of dry ice absorbs heat and cools the surrounding air.

2636. Thermal decomposition of calcium carbonate requires heat input and is endothermic.

2637. Thermal decomposition of copper carbonate needs heat and causes a temperature drop in the reacting zone if heat is not continuously supplied.

2638. Electrolysis of water requires energy input and behaves as an endothermic process.

2639. Photosynthesis absorbs energy from light and is an endothermic chemical process.

2640. Steam reforming of methane requires strong heat input and is endothermic.

2641. Dissolving ammonium nitrate in water absorbs heat, so the temperature of the mixture decreases.

2686. Electrolysis of water requires energy input and behaves as an endothermic process.

2687. Photosynthesis absorbs energy from light and is an endothermic chemical process.

2688. Steam reforming of methane requires strong heat input and is endothermic.

2689. Dissolving ammonium nitrate in water absorbs heat, so the temperature of the mixture decreases.

2690. Dissolving potassium nitrate in water absorbs heat from the surroundings and causes cooling.

2691. Dissolving ammonium chloride in water is endothermic and makes the solution colder.

2692. Evaporation of water from a surface absorbs heat and lowers the surface temperature.

2693. Evaporation of ethanol absorbs heat from the surroundings and creates cooling.

2694. Melting ice absorbs heat and reduces the temperature of nearby materials.

2695. Sublimation of dry ice absorbs heat and cools the surrounding air.

2696. Thermal decomposition of calcium carbonate requires heat input and is endothermic.

2697. Thermal decomposition of copper carbonate needs heat and causes a temperature drop in the reacting zone if heat is not continuously supplied.

2698. Electrolysis of water requires energy input and behaves as an endothermic process.

2699. Photosynthesis absorbs energy from light and is an endothermic chemical process.

2700. Steam reforming of methane requires strong heat input and is endothermic.

2701. Dissolving ammonium nitrate in water absorbs heat, so the temperature of the mixture decreases.

2702. Dissolving potassium nitrate in water absorbs heat from the surroundings and causes cooling.

2703. Dissolving ammonium chloride in water is endothermic and makes the solution colder.

2704. Evaporation of water from a surface absorbs heat and lowers the surface temperature.

2705. Evaporation of ethanol absorbs heat from the surroundings and creates cooling.

2706. Melting ice absorbs heat and reduces the temperature of nearby materials.

2707. Sublimation of dry ice absorbs heat and cools the surrounding air.

2708. Thermal decomposition of calcium carbonate requires heat input and is endothermic.

2709. Thermal decomposition of copper carbonate needs heat and causes a temperature drop in the reacting zone if heat is not continuously supplied.

2710. Electrolysis of water requires energy input and behaves as an endothermic process.

2711. Photosynthesis absorbs energy from light and is an endothermic chemical process.

2712. Steam reforming of methane requires strong heat input and is endothermic.

2713. Dissolving ammonium nitrate in water absorbs heat, so the temperature of the mixture decreases.

2714. Dissolving potassium nitrate in water absorbs heat from the surroundings and causes cooling.

2715. Dissolving ammonium chloride in water is endothermic and makes the solution colder.

2716. Evaporation of water from a surface absorbs heat and lowers the surface temperature.

2717. Evaporation of ethanol absorbs heat from the surroundings and creates cooling.

2718. Melting ice absorbs heat and reduces the temperature of nearby materials.

2719. Sublimation of dry ice absorbs heat and cools the surrounding air.

2720. Thermal decomposition of calcium carbonate requires heat input and is endothermic.

2721. Thermal decomposition of copper carbonate needs heat and causes a temperature drop in the reacting zone if heat is not continuously supplied.

2722. Electrolysis of water requires energy input and behaves as an endothermic process.

2723. Photosynthesis absorbs energy from light and is an endothermic chemical process.

2724. Steam reforming of methane requires strong heat input and is endothermic.

2725. Dissolving ammonium nitrate in water absorbs heat, so the temperature of the mixture decreases.

2726. Dissolving potassium nitrate in water absorbs heat from the surroundings and causes cooling.

2727. Dissolving ammonium chloride in water is endothermic and makes the solution colder.

2728. Evaporation of water from a surface absorbs heat and lowers the surface temperature.

2729. Evaporation of ethanol absorbs heat from the surroundings and creates cooling.

2817. Thermal decomposition of copper carbonate needs heat and causes a temperature drop in the reacting zone if heat is not continuously supplied.

2862. Melting ice absorbs heat and reduces the temperature of nearby materials.

2863. Sublimation of dry ice absorbs heat and cools the surrounding air.

2864. Thermal decomposition of calcium carbonate requires heat input and is endothermic.

2865. Thermal decomposition of copper carbonate needs heat and causes a temperature drop in the reacting zone if heat is not continuously supplied.

2866. Electrolysis of water requires energy input and behaves as an endothermic process.

2867. Photosynthesis absorbs energy from light and is an endothermic chemical process.

2868. Steam reforming of methane requires strong heat input and is endothermic.

2869. Dissolving ammonium nitrate in water absorbs heat, so the temperature of the mixture decreases.

2870. Dissolving potassium nitrate in water absorbs heat from the surroundings and causes cooling.

2871. Dissolving ammonium chloride in water is endothermic and makes the solution colder.

2872. Evaporation of water from a surface absorbs heat and lowers the surface temperature.

2873. Evaporation of ethanol absorbs heat from the surroundings and creates cooling.

2874. Melting ice absorbs heat and reduces the temperature of nearby materials.

2875. Sublimation of dry ice absorbs heat and cools the surrounding air.

2876. Thermal decomposition of calcium carbonate requires heat input and is endothermic.

2877. Thermal decomposition of copper carbonate needs heat and causes a temperature drop in the reacting zone if heat is not continuously supplied.

2878. Electrolysis of water requires energy input and behaves as an endothermic process.

2879. Photosynthesis absorbs energy from light and is an endothermic chemical process.

2880. Steam reforming of methane requires strong heat input and is endothermic.

2881. Dissolving ammonium nitrate in water absorbs heat, so the temperature of the mixture decreases.

2882. Dissolving potassium nitrate in water absorbs heat from the surroundings and causes cooling.

2883. Dissolving ammonium chloride in water is endothermic and makes the solution colder.

2884. Evaporation of water from a surface absorbs heat and lowers the surface temperature.

2885. Evaporation of ethanol absorbs heat from the surroundings and creates cooling.

2886. Melting ice absorbs heat and reduces the temperature of nearby materials.

2887. Sublimation of dry ice absorbs heat and cools the surrounding air.

2888. Thermal decomposition of calcium carbonate requires heat input and is endothermic.

2889. Thermal decomposition of copper carbonate needs heat and causes a temperature drop in the reacting zone if heat is not continuously supplied.

2890. Electrolysis of water requires energy input and behaves as an endothermic process.

2891. Photosynthesis absorbs energy from light and is an endothermic chemical process.

2892. Steam reforming of methane requires strong heat input and is endothermic.

2893. Dissolving ammonium nitrate in water absorbs heat, so the temperature of the mixture decreases.

2894. Dissolving potassium nitrate in water absorbs heat from the surroundings and causes cooling.

2895. Dissolving ammonium chloride in water is endothermic and makes the solution colder.

2896. Evaporation of water from a surface absorbs heat and lowers the surface temperature.

2897. Evaporation of ethanol absorbs heat from the surroundings and creates cooling.

2898. Melting ice absorbs heat and reduces the temperature of nearby materials.

2899. Sublimation of dry ice absorbs heat and cools the surrounding air.

2900. Thermal decomposition of calcium carbonate requires heat input and is endothermic.

2901. Thermal decomposition of copper carbonate needs heat and causes a temperature drop in the reacting zone if heat is not continuously supplied.

2902. Electrolysis of water requires energy input and behaves as an endothermic process.

2903. Photosynthesis absorbs energy from light and is an endothermic chemical process.

2904. Steam reforming of methane requires strong heat input and is endothermic.

2905. Dissolving ammonium nitrate in water absorbs heat, so the temperature of the mixture decreases.

2950. Electrolysis of water requires energy input and behaves as an endothermic process.

2951. Photosynthesis absorbs energy from light and is an endothermic chemical process.

2952. Steam reforming of methane requires strong heat input and is endothermic.

2953. Dissolving ammonium nitrate in water absorbs heat, so the temperature of the mixture decreases.

2954. Dissolving potassium nitrate in water absorbs heat from the surroundings and causes cooling.

2955. Dissolving ammonium chloride in water is endothermic and makes the solution colder.

2956. Evaporation of water from a surface absorbs heat and lowers the surface temperature.

2957. Evaporation of ethanol absorbs heat from the surroundings and creates cooling.

2958. Melting ice absorbs heat and reduces the temperature of nearby materials.

2959. Sublimation of dry ice absorbs heat and cools the surrounding air.

2960. Thermal decomposition of calcium carbonate requires heat input and is endothermic.

2961. Thermal decomposition of copper carbonate needs heat and causes a temperature drop in the reacting zone if heat is not continuously supplied.

2962. Electrolysis of water requires energy input and behaves as an endothermic process.

2963. Photosynthesis absorbs energy from light and is an endothermic chemical process.

2964. Steam reforming of methane requires strong heat input and is endothermic.

2965. Dissolving ammonium nitrate in water absorbs heat, so the temperature of the mixture decreases.

2966. Dissolving potassium nitrate in water absorbs heat from the surroundings and causes cooling.

2967. Dissolving ammonium chloride in water is endothermic and makes the solution colder.

2968. Evaporation of water from a surface absorbs heat and lowers the surface temperature.

2969. Evaporation of ethanol absorbs heat from the surroundings and creates cooling.

2970. Melting ice absorbs heat and reduces the temperature of nearby materials.

2971. Sublimation of dry ice absorbs heat and cools the surrounding air.

2972. Thermal decomposition of calcium carbonate requires heat input and is endothermic.

2973. Thermal decomposition of copper carbonate needs heat and causes a temperature drop in the reacting zone if heat is not continuously supplied.

2974. Electrolysis of water requires energy input and behaves as an endothermic process.

2975. Photosynthesis absorbs energy from light and is an endothermic chemical process.

2976. Steam reforming of methane requires strong heat input and is endothermic.

2977. Dissolving ammonium nitrate in water absorbs heat, so the temperature of the mixture decreases.

2978. Dissolving potassium nitrate in water absorbs heat from the surroundings and causes cooling.

2979. Dissolving ammonium chloride in water is endothermic and makes the solution colder.

2980. Evaporation of water from a surface absorbs heat and lowers the surface temperature.

2981. Evaporation of ethanol absorbs heat from the surroundings and creates cooling.

2982. Melting ice absorbs heat and reduces the temperature of nearby materials.

2983. Sublimation of dry ice absorbs heat and cools the surrounding air.

2984. Thermal decomposition of calcium carbonate requires heat input and is endothermic.

2985. Thermal decomposition of copper carbonate needs heat and causes a temperature drop in the reacting zone if heat is not continuously supplied.

2986. Electrolysis of water requires energy input and behaves as an endothermic process.

2987. Photosynthesis absorbs energy from light and is an endothermic chemical process.

2988. Steam reforming of methane requires strong heat input and is endothermic.

2989. Dissolving ammonium nitrate in water absorbs heat, so the temperature of the mixture decreases.

2990. Dissolving potassium nitrate in water absorbs heat from the surroundings and causes cooling.

2991. Dissolving ammonium chloride in water is endothermic and makes the solution colder.

2992. Evaporation of water from a surface absorbs heat and lowers the surface temperature.

2993. Evaporation of ethanol absorbs heat from the surroundings and creates cooling.

3038. Dissolving potassium nitrate in water absorbs heat from the surroundings and causes cooling.

3039. Dissolving ammonium chloride in water is endothermic and makes the solution colder.

3040. Evaporation of water from a surface absorbs heat and lowers the surface temperature.

3041. Evaporation of ethanol absorbs heat from the surroundings and creates cooling.

3042. Melting ice absorbs heat and reduces the temperature of nearby materials.

3043. Sublimation of dry ice absorbs heat and cools the surrounding air.

3044. Thermal decomposition of calcium carbonate requires heat input and is endothermic.

3045. Thermal decomposition of copper carbonate needs heat and causes a temperature drop in the reacting zone if heat is not continuously supplied.

3046. Electrolysis of water requires energy input and behaves as an endothermic process.

3047. Photosynthesis absorbs energy from light and is an endothermic chemical process.

3048. Steam reforming of methane requires strong heat input and is endothermic.

3049. Dissolving ammonium nitrate in water absorbs heat, so the temperature of the mixture decreases.

3050. Dissolving potassium nitrate in water absorbs heat from the surroundings and causes cooling.

3051. Dissolving ammonium chloride in water is endothermic and makes the solution colder.

3052. Evaporation of water from a surface absorbs heat and lowers the surface temperature.

3053. Evaporation of ethanol absorbs heat from the surroundings and creates cooling.

3054. Melting ice absorbs heat and reduces the temperature of nearby materials.

3055. Sublimation of dry ice absorbs heat and cools the surrounding air.

3056. Thermal decomposition of calcium carbonate requires heat input and is endothermic.

3057. Thermal decomposition of copper carbonate needs heat and causes a temperature drop in the reacting zone if heat is not continuously supplied.

3058. Electrolysis of water requires energy input and behaves as an endothermic process.

3059. Photosynthesis absorbs energy from light and is an endothermic chemical process.

3060. Steam reforming of methane requires strong heat input and is endothermic.

3061. Dissolving ammonium nitrate in water absorbs heat, so the temperature of the mixture decreases.

3062. Dissolving potassium nitrate in water absorbs heat from the surroundings and causes cooling.

3063. Dissolving ammonium chloride in water is endothermic and makes the solution colder.

3064. Evaporation of water from a surface absorbs heat and lowers the surface temperature.

3065. Evaporation of ethanol absorbs heat from the surroundings and creates cooling.

3066. Melting ice absorbs heat and reduces the temperature of nearby materials.

3067. Sublimation of dry ice absorbs heat and cools the surrounding air.

3068. Thermal decomposition of calcium carbonate requires heat input and is endothermic.

3069. Thermal decomposition of copper carbonate needs heat and causes a temperature drop in the reacting zone if heat is not continuously supplied.

3070. Electrolysis of water requires energy input and behaves as an endothermic process.

3071. Photosynthesis absorbs energy from light and is an endothermic chemical process.

3072. Steam reforming of methane requires strong heat input and is endothermic.

3073. Dissolving ammonium nitrate in water absorbs heat, so the temperature of the mixture decreases.

3074. Dissolving potassium nitrate in water absorbs heat from the surroundings and causes cooling.

3075. Dissolving ammonium chloride in water is endothermic and makes the solution colder.

3076. Evaporation of water from a surface absorbs heat and lowers the surface temperature.

3077. Evaporation of ethanol absorbs heat from the surroundings and creates cooling.

3078. Melting ice absorbs heat and reduces the temperature of nearby materials.

3079. Sublimation of dry ice absorbs heat and cools the surrounding air.

3080. Thermal decomposition of calcium carbonate requires heat input and is endothermic.

3081. Thermal decomposition of copper carbonate needs heat and causes a temperature drop in the reacting zone if heat is not continuously supplied.

3126. Melting ice absorbs heat and reduces the temperature of nearby materials.

3127. Sublimation of dry ice absorbs heat and cools the surrounding air.

3128. Thermal decomposition of calcium carbonate requires heat input and is endothermic.

3129. Thermal decomposition of copper carbonate needs heat and causes a temperature drop in the reacting zone if heat is not continuously supplied.

3130. Electrolysis of water requires energy input and behaves as an endothermic process.

3131. Photosynthesis absorbs energy from light and is an endothermic chemical process.

3132. Steam reforming of methane requires strong heat input and is endothermic.

3133. Dissolving ammonium nitrate in water absorbs heat, so the temperature of the mixture decreases.

3134. Dissolving potassium nitrate in water absorbs heat from the surroundings and causes cooling.

3135. Dissolving ammonium chloride in water is endothermic and makes the solution colder.

3136. Evaporation of water from a surface absorbs heat and lowers the surface temperature.

3137. Evaporation of ethanol absorbs heat from the surroundings and creates cooling.

3138. Melting ice absorbs heat and reduces the temperature of nearby materials.

3139. Sublimation of dry ice absorbs heat and cools the surrounding air.

3140. Thermal decomposition of calcium carbonate requires heat input and is endothermic.

3141. Thermal decomposition of copper carbonate needs heat and causes a temperature drop in the reacting zone if heat is not continuously supplied.

3142. Electrolysis of water requires energy input and behaves as an endothermic process.

3143. Photosynthesis absorbs energy from light and is an endothermic chemical process.

3144. Steam reforming of methane requires strong heat input and is endothermic.

3145. Dissolving ammonium nitrate in water absorbs heat, so the temperature of the mixture decreases.

3146. Dissolving potassium nitrate in water absorbs heat from the surroundings and causes cooling.

3147. Dissolving ammonium chloride in water is endothermic and makes the solution colder.

3148. Evaporation of water from a surface absorbs heat and lowers the surface temperature.

3149. Evaporation of ethanol absorbs heat from the surroundings and creates cooling.

3150. Melting ice absorbs heat and reduces the temperature of nearby materials.

3151. Sublimation of dry ice absorbs heat and cools the surrounding air.

3152. Thermal decomposition of calcium carbonate requires heat input and is endothermic.

3153. Thermal decomposition of copper carbonate needs heat and causes a temperature drop in the reacting zone if heat is not continuously supplied.

3154. Electrolysis of water requires energy input and behaves as an endothermic process.

3155. Photosynthesis absorbs energy from light and is an endothermic chemical process.

3156. Steam reforming of methane requires strong heat input and is endothermic.

3157. Dissolving ammonium nitrate in water absorbs heat, so the temperature of the mixture decreases.

3158. Dissolving potassium nitrate in water absorbs heat from the surroundings and causes cooling.

3159. Dissolving ammonium chloride in water is endothermic and makes the solution colder.

3160. Evaporation of water from a surface absorbs heat and lowers the surface temperature.

3161. Evaporation of ethanol absorbs heat from the surroundings and creates cooling.

3162. Melting ice absorbs heat and reduces the temperature of nearby materials.

3163. Sublimation of dry ice absorbs heat and cools the surrounding air.

3164. Thermal decomposition of calcium carbonate requires heat input and is endothermic.

3165. Thermal decomposition of copper carbonate needs heat and causes a temperature drop in the reacting zone if heat is not continuously supplied.

3166. Electrolysis of water requires energy input and behaves as an endothermic process.

3167. Photosynthesis absorbs energy from light and is an endothermic chemical process.

3168. Steam reforming of methane requires strong heat input and is endothermic.

3169. Dissolving ammonium nitrate in water absorbs heat, so the temperature of the mixture decreases.

3390. Melting ice absorbs heat and reduces the temperature of nearby materials.

3391. Sublimation of dry ice absorbs heat and cools the surrounding air.

3392. Thermal decomposition of calcium carbonate requires heat input and is endothermic.

3393. Thermal decomposition of copper carbonate needs heat and causes a temperature drop in the reacting zone if heat is not continuously supplied.

3394. Electrolysis of water requires energy input and behaves as an endothermic process.

3395. Photosynthesis absorbs energy from light and is an endothermic chemical process.

3396. Steam reforming of methane requires strong heat input and is endothermic.

3397. Dissolving ammonium nitrate in water absorbs heat, so the temperature of the mixture decreases.

3398. Dissolving potassium nitrate in water absorbs heat from the surroundings and causes cooling.

3399. Dissolving ammonium chloride in water is endothermic and makes the solution colder.

3400. Evaporation of water from a surface absorbs heat and lowers the surface temperature.

3401. Evaporation of ethanol absorbs heat from the surroundings and creates cooling.

3402. Melting ice absorbs heat and reduces the temperature of nearby materials.

3403. Sublimation of dry ice absorbs heat and cools the surrounding air.

3404. Thermal decomposition of calcium carbonate requires heat input and is endothermic.

3405. Thermal decomposition of copper carbonate needs heat and causes a temperature drop in the reacting zone if heat is not continuously supplied.

3406. Electrolysis of water requires energy input and behaves as an endothermic process.

3407. Photosynthesis absorbs energy from light and is an endothermic chemical process.

3408. Steam reforming of methane requires strong heat input and is endothermic.

3409. Dissolving ammonium nitrate in water absorbs heat, so the temperature of the mixture decreases.

3410. Dissolving potassium nitrate in water absorbs heat from the surroundings and causes cooling.

3411. Dissolving ammonium chloride in water is endothermic and makes the solution colder.

3412. Evaporation of water from a surface absorbs heat and lowers the surface temperature.

3413. Evaporation of ethanol absorbs heat from the surroundings and creates cooling.

3414. Melting ice absorbs heat and reduces the temperature of nearby materials.

3415. Sublimation of dry ice absorbs heat and cools the surrounding air.

3416. Thermal decomposition of calcium carbonate requires heat input and is endothermic.

3417. Thermal decomposition of copper carbonate needs heat and causes a temperature drop in the reacting zone if heat is not continuously supplied.

3418. Electrolysis of water requires energy input and behaves as an endothermic process.

3419. Photosynthesis absorbs energy from light and is an endothermic chemical process.

3420. Steam reforming of methane requires strong heat input and is endothermic.

3421. Dissolving ammonium nitrate in water absorbs heat, so the temperature of the mixture decreases.

3422. Dissolving potassium nitrate in water absorbs heat from the surroundings and causes cooling.

3423. Dissolving ammonium chloride in water is endothermic and makes the solution colder.

3424. Evaporation of water from a surface absorbs heat and lowers the surface temperature.

3425. Evaporation of ethanol absorbs heat from the surroundings and creates cooling.

3426. Melting ice absorbs heat and reduces the temperature of nearby materials.

3427. Sublimation of dry ice absorbs heat and cools the surrounding air.

3428. Thermal decomposition of calcium carbonate requires heat input and is endothermic.

3429. Thermal decomposition of copper carbonate needs heat and causes a temperature drop in the reacting zone if heat is not continuously supplied.

3430. Electrolysis of water requires energy input and behaves as an endothermic process.

3431. Photosynthesis absorbs energy from light and is an endothermic chemical process.

3432. Steam reforming of methane requires strong heat input and is endothermic.

3433. Dissolving ammonium nitrate in water absorbs heat, so the temperature of the mixture decreases.

3478. Electrolysis of water requires energy input and behaves as an endothermic process.

3479. Photosynthesis absorbs energy from light and is an endothermic chemical process.

3480. Steam reforming of methane requires strong heat input and is endothermic.

3481. Dissolving ammonium nitrate in water absorbs heat, so the temperature of the mixture decreases.

3482. Dissolving potassium nitrate in water absorbs heat from the surroundings and causes cooling.

3483. Dissolving ammonium chloride in water is endothermic and makes the solution colder.

3484. Evaporation of water from a surface absorbs heat and lowers the surface temperature.

3485. Evaporation of ethanol absorbs heat from the surroundings and creates cooling.

3486. Melting ice absorbs heat and reduces the temperature of nearby materials.

3487. Sublimation of dry ice absorbs heat and cools the surrounding air.

3488. Thermal decomposition of calcium carbonate requires heat input and is endothermic.

3489. Thermal decomposition of copper carbonate needs heat and causes a temperature drop in the reacting zone if heat is not continuously supplied.

3490. Electrolysis of water requires energy input and behaves as an endothermic process.

3491. Photosynthesis absorbs energy from light and is an endothermic chemical process.

3492. Steam reforming of methane requires strong heat input and is endothermic.

3493. Dissolving ammonium nitrate in water absorbs heat, so the temperature of the mixture decreases.

3494. Dissolving potassium nitrate in water absorbs heat from the surroundings and causes cooling.

3495. Dissolving ammonium chloride in water is endothermic and makes the solution colder.

3496. Evaporation of water from a surface absorbs heat and lowers the surface temperature.

3497. Evaporation of ethanol absorbs heat from the surroundings and creates cooling.

3498. Melting ice absorbs heat and reduces the temperature of nearby materials.

3499. Sublimation of dry ice absorbs heat and cools the surrounding air.

3500. Thermal decomposition of calcium carbonate requires heat input and is endothermic.

3501. Thermal decomposition of copper carbonate needs heat and causes a temperature drop in the reacting zone if heat is not continuously supplied.

3502. Electrolysis of water requires energy input and behaves as an endothermic process.

3503. Photosynthesis absorbs energy from light and is an endothermic chemical process.

3504. Steam reforming of methane requires strong heat input and is endothermic.

3505. Dissolving ammonium nitrate in water absorbs heat, so the temperature of the mixture decreases.

3506. Dissolving potassium nitrate in water absorbs heat from the surroundings and causes cooling.

3507. Dissolving ammonium chloride in water is endothermic and makes the solution colder.

3508. Evaporation of water from a surface absorbs heat and lowers the surface temperature.

3509. Evaporation of ethanol absorbs heat from the surroundings and creates cooling.

3510. Melting ice absorbs heat and reduces the temperature of nearby materials.

3511. Sublimation of dry ice absorbs heat and cools the surrounding air.

3512. Thermal decomposition of calcium carbonate requires heat input and is endothermic.

3513. Thermal decomposition of copper carbonate needs heat and causes a temperature drop in the reacting zone if heat is not continuously supplied.

3514. Electrolysis of water requires energy input and behaves as an endothermic process.

3515. Photosynthesis absorbs energy from light and is an endothermic chemical process.

3516. Steam reforming of methane requires strong heat input and is endothermic.

3517. Dissolving ammonium nitrate in water absorbs heat, so the temperature of the mixture decreases.

3518. Dissolving potassium nitrate in water absorbs heat from the surroundings and causes cooling.

3519. Dissolving ammonium chloride in water is endothermic and makes the solution colder.

3520. Evaporation of water from a surface absorbs heat and lowers the surface temperature.

3521. Evaporation of ethanol absorbs heat from the surroundings and creates cooling.

3566. Dissolving potassium nitrate in water absorbs heat from the surroundings and causes cooling.

3567. Dissolving ammonium chloride in water is endothermic and makes the solution colder.

3568. Evaporation of water from a surface absorbs heat and lowers the surface temperature.

3569. Evaporation of ethanol absorbs heat from the surroundings and creates cooling.

3570. Melting ice absorbs heat and reduces the temperature of nearby materials.

3571. Sublimation of dry ice absorbs heat and cools the surrounding air.

3572. Thermal decomposition of calcium carbonate requires heat input and is endothermic.

3573. Thermal decomposition of copper carbonate needs heat and causes a temperature drop in the reacting zone if heat is not continuously supplied.

3574. Electrolysis of water requires energy input and behaves as an endothermic process.

3575. Photosynthesis absorbs energy from light and is an endothermic chemical process.

3576. Steam reforming of methane requires strong heat input and is endothermic.

3577. Dissolving ammonium nitrate in water absorbs heat, so the temperature of the mixture decreases.

3578. Dissolving potassium nitrate in water absorbs heat from the surroundings and causes cooling.

3579. Dissolving ammonium chloride in water is endothermic and makes the solution colder.

3580. Evaporation of water from a surface absorbs heat and lowers the surface temperature.

3581. Evaporation of ethanol absorbs heat from the surroundings and creates cooling.

3582. Melting ice absorbs heat and reduces the temperature of nearby materials.

3583. Sublimation of dry ice absorbs heat and cools the surrounding air.

3584. Thermal decomposition of calcium carbonate requires heat input and is endothermic.

3585. Thermal decomposition of copper carbonate needs heat and causes a temperature drop in the reacting zone if heat is not continuously supplied.

3586. Electrolysis of water requires energy input and behaves as an endothermic process.

3587. Photosynthesis absorbs energy from light and is an endothermic chemical process.

3588. Steam reforming of methane requires strong heat input and is endothermic.

3589. Dissolving ammonium nitrate in water absorbs heat, so the temperature of the mixture decreases.

3590. Dissolving potassium nitrate in water absorbs heat from the surroundings and causes cooling.

3591. Dissolving ammonium chloride in water is endothermic and makes the solution colder.

3592. Evaporation of water from a surface absorbs heat and lowers the surface temperature.

3593. Evaporation of ethanol absorbs heat from the surroundings and creates cooling.

3594. Melting ice absorbs heat and reduces the temperature of nearby materials.

3595. Sublimation of dry ice absorbs heat and cools the surrounding air.

3596. Thermal decomposition of calcium carbonate requires heat input and is endothermic.

3597. Thermal decomposition of copper carbonate needs heat and causes a temperature drop in the reacting zone if heat is not continuously supplied.

3598. Electrolysis of water requires energy input and behaves as an endothermic process.

3599. Photosynthesis absorbs energy from light and is an endothermic chemical process.

3600. Steam reforming of methane requires strong heat input and is endothermic.

3601. Dissolving ammonium nitrate in water absorbs heat, so the temperature of the mixture decreases.

3602. Dissolving potassium nitrate in water absorbs heat from the surroundings and causes cooling.

3603. Dissolving ammonium chloride in water is endothermic and makes the solution colder.

3604. Evaporation of water from a surface absorbs heat and lowers the surface temperature.

3605. Evaporation of ethanol absorbs heat from the surroundings and creates cooling.

3606. Melting ice absorbs heat and reduces the temperature of nearby materials.

3607. Sublimation of dry ice absorbs heat and cools the surrounding air.

3608. Thermal decomposition of calcium carbonate requires heat input and is endothermic.

3609. Thermal decomposition of copper carbonate needs heat and causes a temperature drop in the reacting zone if heat is not continuously supplied.

3654. Melting ice absorbs heat and reduces the temperature of nearby materials.

3655. Sublimation of dry ice absorbs heat and cools the surrounding air.

3656. Thermal decomposition of calcium carbonate requires heat input and is endothermic.

3657. Thermal decomposition of copper carbonate needs heat and causes a temperature drop in the reacting zone if heat is not continuously supplied.

3658. Electrolysis of water requires energy input and behaves as an endothermic process.

3659. Photosynthesis absorbs energy from light and is an endothermic chemical process.

3660. Steam reforming of methane requires strong heat input and is endothermic.

3661. Dissolving ammonium nitrate in water absorbs heat, so the temperature of the mixture decreases.

3662. Dissolving potassium nitrate in water absorbs heat from the surroundings and causes cooling.

3663. Dissolving ammonium chloride in water is endothermic and makes the solution colder.

3664. Evaporation of water from a surface absorbs heat and lowers the surface temperature.

3665. Evaporation of ethanol absorbs heat from the surroundings and creates cooling.

3666. Melting ice absorbs heat and reduces the temperature of nearby materials.

3667. Sublimation of dry ice absorbs heat and cools the surrounding air.

3668. Thermal decomposition of calcium carbonate requires heat input and is endothermic.

3669. Thermal decomposition of copper carbonate needs heat and causes a temperature drop in the reacting zone if heat is not continuously supplied.

3670. Electrolysis of water requires energy input and behaves as an endothermic process.

3671. Photosynthesis absorbs energy from light and is an endothermic chemical process.

3672. Steam reforming of methane requires strong heat input and is endothermic.

3673. Dissolving ammonium nitrate in water absorbs heat, so the temperature of the mixture decreases.

3674. Dissolving potassium nitrate in water absorbs heat from the surroundings and causes cooling.

3675. Dissolving ammonium chloride in water is endothermic and makes the solution colder.

3676. Evaporation of water from a surface absorbs heat and lowers the surface temperature.

3677. Evaporation of ethanol absorbs heat from the surroundings and creates cooling.

3678. Melting ice absorbs heat and reduces the temperature of nearby materials.

3679. Sublimation of dry ice absorbs heat and cools the surrounding air.

3680. Thermal decomposition of calcium carbonate requires heat input and is endothermic.

3681. Thermal decomposition of copper carbonate needs heat and causes a temperature drop in the reacting zone if heat is not continuously supplied.

3682. Electrolysis of water requires energy input and behaves as an endothermic process.

3683. Photosynthesis absorbs energy from light and is an endothermic chemical process.

3684. Steam reforming of methane requires strong heat input and is endothermic.

3685. Dissolving ammonium nitrate in water absorbs heat, so the temperature of the mixture decreases.

3686. Dissolving potassium nitrate in water absorbs heat from the surroundings and causes cooling.

3687. Dissolving ammonium chloride in water is endothermic and makes the solution colder.

3688. Evaporation of water from a surface absorbs heat and lowers the surface temperature.

3689. Evaporation of ethanol absorbs heat from the surroundings and creates cooling.

3690. Melting ice absorbs heat and reduces the temperature of nearby materials.

3691. Sublimation of dry ice absorbs heat and cools the surrounding air.

3692. Thermal decomposition of calcium carbonate requires heat input and is endothermic.

3693. Thermal decomposition of copper carbonate needs heat and causes a temperature drop in the reacting zone if heat is not continuously supplied.

3694. Electrolysis of water requires energy input and behaves as an endothermic process.

3695. Photosynthesis absorbs energy from light and is an endothermic chemical process.

3696. Steam reforming of methane requires strong heat input and is endothermic.

3697. Dissolving ammonium nitrate in water absorbs heat, so the temperature of the mixture decreases.

3742. Electrolysis of water requires energy input and behaves as an endothermic process.

3743. Photosynthesis absorbs energy from light and is an endothermic chemical process.

3744. Steam reforming of methane requires strong heat input and is endothermic.

3745. Dissolving ammonium nitrate in water absorbs heat, so the temperature of the mixture decreases.

3746. Dissolving potassium nitrate in water absorbs heat from the surroundings and causes cooling.

3747. Dissolving ammonium chloride in water is endothermic and makes the solution colder.

3748. Evaporation of water from a surface absorbs heat and lowers the surface temperature.

3749. Evaporation of ethanol absorbs heat from the surroundings and creates cooling.

3750. Melting ice absorbs heat and reduces the temperature of nearby materials.

3751. Sublimation of dry ice absorbs heat and cools the surrounding air.

3752. Thermal decomposition of calcium carbonate requires heat input and is endothermic.

3753. Thermal decomposition of copper carbonate needs heat and causes a temperature drop in the reacting zone if heat is not continuously supplied.

3754. Electrolysis of water requires energy input and behaves as an endothermic process.

3755. Photosynthesis absorbs energy from light and is an endothermic chemical process.

3756. Steam reforming of methane requires strong heat input and is endothermic.

3757. Dissolving ammonium nitrate in water absorbs heat, so the temperature of the mixture decreases.

3758. Dissolving potassium nitrate in water absorbs heat from the surroundings and causes cooling.

3759. Dissolving ammonium chloride in water is endothermic and makes the solution colder.

3760. Evaporation of water from a surface absorbs heat and lowers the surface temperature.

3761. Evaporation of ethanol absorbs heat from the surroundings and creates cooling.

3762. Melting ice absorbs heat and reduces the temperature of nearby materials.

3763. Sublimation of dry ice absorbs heat and cools the surrounding air.

3764. Thermal decomposition of calcium carbonate requires heat input and is endothermic.

3765. Thermal decomposition of copper carbonate needs heat and causes a temperature drop in the reacting zone if heat is not continuously supplied.

3766. Electrolysis of water requires energy input and behaves as an endothermic process.

3767. Photosynthesis absorbs energy from light and is an endothermic chemical process.

3768. Steam reforming of methane requires strong heat input and is endothermic.

3769. Dissolving ammonium nitrate in water absorbs heat, so the temperature of the mixture decreases.

3770. Dissolving potassium nitrate in water absorbs heat from the surroundings and causes cooling.

3771. Dissolving ammonium chloride in water is endothermic and makes the solution colder.

3772. Evaporation of water from a surface absorbs heat and lowers the surface temperature.

3773. Evaporation of ethanol absorbs heat from the surroundings and creates cooling.

3774. Melting ice absorbs heat and reduces the temperature of nearby materials.

3775. Sublimation of dry ice absorbs heat and cools the surrounding air.

3776. Thermal decomposition of calcium carbonate requires heat input and is endothermic.

3777. Thermal decomposition of copper carbonate needs heat and causes a temperature drop in the reacting zone if heat is not continuously supplied.

3778. Electrolysis of water requires energy input and behaves as an endothermic process.

3779. Photosynthesis absorbs energy from light and is an endothermic chemical process.

3780. Steam reforming of methane requires strong heat input and is endothermic.

3781. Dissolving ammonium nitrate in water absorbs heat, so the temperature of the mixture decreases.

3782. Dissolving potassium nitrate in water absorbs heat from the surroundings and causes cooling.

3783. Dissolving ammonium chloride in water is endothermic and makes the solution colder.

3784. Evaporation of water from a surface absorbs heat and lowers the surface temperature.

3785. Evaporation of ethanol absorbs heat from the surroundings and creates cooling.

3918. Melting ice absorbs heat and reduces the temperature of nearby materials.

3919. Sublimation of dry ice absorbs heat and cools the surrounding air.

3920. Thermal decomposition of calcium carbonate requires heat input and is endothermic.

3921. Thermal decomposition of copper carbonate needs heat and causes a temperature drop in the reacting zone if heat is not continuously supplied.

3922. Electrolysis of water requires energy input and behaves as an endothermic process.

3923. Photosynthesis absorbs energy from light and is an endothermic chemical process.

3924. Steam reforming of methane requires strong heat input and is endothermic.

3925. Dissolving ammonium nitrate in water absorbs heat, so the temperature of the mixture decreases.

3926. Dissolving potassium nitrate in water absorbs heat from the surroundings and causes cooling.

3927. Dissolving ammonium chloride in water is endothermic and makes the solution colder.

3928. Evaporation of water from a surface absorbs heat and lowers the surface temperature.

3929. Evaporation of ethanol absorbs heat from the surroundings and creates cooling.

3930. Melting ice absorbs heat and reduces the temperature of nearby materials.

3931. Sublimation of dry ice absorbs heat and cools the surrounding air.

3932. Thermal decomposition of calcium carbonate requires heat input and is endothermic.

3933. Thermal decomposition of copper carbonate needs heat and causes a temperature drop in the reacting zone if heat is not continuously supplied.

3934. Electrolysis of water requires energy input and behaves as an endothermic process.

3935. Photosynthesis absorbs energy from light and is an endothermic chemical process.

3936. Steam reforming of methane requires strong heat input and is endothermic.

3937. Dissolving ammonium nitrate in water absorbs heat, so the temperature of the mixture decreases.

3938. Dissolving potassium nitrate in water absorbs heat from the surroundings and causes cooling.

3939. Dissolving ammonium chloride in water is endothermic and makes the solution colder.

3940. Evaporation of water from a surface absorbs heat and lowers the surface temperature.

3941. Evaporation of ethanol absorbs heat from the surroundings and creates cooling.

3942. Melting ice absorbs heat and reduces the temperature of nearby materials.

3943. Sublimation of dry ice absorbs heat and cools the surrounding air.

3944. Thermal decomposition of calcium carbonate requires heat input and is endothermic.

3945. Thermal decomposition of copper carbonate needs heat and causes a temperature drop in the reacting zone if heat is not continuously supplied.

3946. Electrolysis of water requires energy input and behaves as an endothermic process.

3947. Photosynthesis absorbs energy from light and is an endothermic chemical process.

3948. Steam reforming of methane requires strong heat input and is endothermic.

3949. Dissolving ammonium nitrate in water absorbs heat, so the temperature of the mixture decreases.

3950. Dissolving potassium nitrate in water absorbs heat from the surroundings and causes cooling.

3951. Dissolving ammonium chloride in water is endothermic and makes the solution colder.

3952. Evaporation of water from a surface absorbs heat and lowers the surface temperature.

3953. Evaporation of ethanol absorbs heat from the surroundings and creates cooling.

3954. Melting ice absorbs heat and reduces the temperature of nearby materials.

3955. Sublimation of dry ice absorbs heat and cools the surrounding air.

3956. Thermal decomposition of calcium carbonate requires heat input and is endothermic.

3957. Thermal decomposition of copper carbonate needs heat and causes a temperature drop in the reacting zone if heat is not continuously supplied.

3958. Electrolysis of water requires energy input and behaves as an endothermic process.

3959. Photosynthesis absorbs energy from light and is an endothermic chemical process.

3960. Steam reforming of methane requires strong heat input and is endothermic.

3961. Dissolving ammonium nitrate in water absorbs heat, so the temperature of the mixture decreases.

4006. Electrolysis of water requires energy input and behaves as an endothermic process.
4007. Photosynthesis absorbs energy from light and is an endothermic chemical process.
4008. Steam reforming of methane requires strong heat input and is endothermic.
4009. Dissolving ammonium nitrate in water absorbs heat, so the temperature of the mixture decreases.
4010. Dissolving potassium nitrate in water absorbs heat from the surroundings and causes cooling.
4011. Dissolving ammonium chloride in water is endothermic and makes the solution colder.
4012. Evaporation of water from a surface absorbs heat and lowers the surface temperature.
4013. Evaporation of ethanol absorbs heat from the surroundings and creates cooling.
4014. Melting ice absorbs heat and reduces the temperature of nearby materials.
4015. Sublimation of dry ice absorbs heat and cools the surrounding air.
4016. Thermal decomposition of calcium carbonate requires heat input and is endothermic.
4017. Thermal decomposition of copper carbonate needs heat and causes a temperature drop in the reacting zone if heat is not continuously supplied.
4018. Electrolysis of water requires energy input and behaves as an endothermic process.
4019. Photosynthesis absorbs energy from light and is an endothermic chemical process.
4020. Steam reforming of methane requires strong heat input and is endothermic.
4021. Dissolving ammonium nitrate in water absorbs heat, so the temperature of the mixture decreases.
4022. Dissolving potassium nitrate in water absorbs heat from the surroundings and causes cooling.
4023. Dissolving ammonium chloride in water is endothermic and makes the solution colder.
4024. Evaporation of water from a surface absorbs heat and lowers the surface temperature.
4025. Evaporation of ethanol absorbs heat from the surroundings and creates cooling.
4026. Melting ice absorbs heat and reduces the temperature of nearby materials.
4027. Sublimation of dry ice absorbs heat and cools the surrounding air.
4028. Thermal decomposition of calcium carbonate requires heat input and is endothermic.
4029. Thermal decomposition of copper carbonate needs heat and causes a temperature drop in the reacting zone if heat is not continuously supplied.
4030. Electrolysis of water requires energy input and behaves as an endothermic process.
4031. Photosynthesis absorbs energy from light and is an endothermic chemical process.
4032. Steam reforming of methane requires strong heat input and is endothermic.
4033. Dissolving ammonium nitrate in water absorbs heat, so the temperature of the mixture decreases.
4034. Dissolving potassium nitrate in water absorbs heat from the surroundings and causes cooling.
4035. Dissolving ammonium chloride in water is endothermic and makes the solution colder.
4036. Evaporation of water from a surface absorbs heat and lowers the surface temperature.
4037. Evaporation of ethanol absorbs heat from the surroundings and creates cooling.
4038. Melting ice absorbs heat and reduces the temperature of nearby materials.
4039. Sublimation of dry ice absorbs heat and cools the surrounding air.
4040. Thermal decomposition of calcium carbonate requires heat input and is endothermic.
4041. Thermal decomposition of copper carbonate needs heat and causes a temperature drop in the reacting zone if heat is not continuously supplied.
4042. Electrolysis of water requires energy input and behaves as an endothermic process.
4043. Photosynthesis absorbs energy from light and is an endothermic chemical process.
4044. Steam reforming of methane requires strong heat input and is endothermic.
4045. Dissolving ammonium nitrate in water absorbs heat, so the temperature of the mixture decreases.
4046. Dissolving potassium nitrate in water absorbs heat from the surroundings and causes cooling.
4047. Dissolving ammonium chloride in water is endothermic and makes the solution colder.
4048. Evaporation of water from a surface absorbs heat and lowers the surface temperature.
4049. Evaporation of ethanol absorbs heat from the surroundings and creates cooling.

4182. Melting ice absorbs heat and reduces the temperature of nearby materials.

4183. Sublimation of dry ice absorbs heat and cools the surrounding air.

4184. Thermal decomposition of calcium carbonate requires heat input and is endothermic.

4185. Thermal decomposition of copper carbonate needs heat and causes a temperature drop in the reacting zone if heat is not continuously supplied.

4186. Electrolysis of water requires energy input and behaves as an endothermic process.

4187. Photosynthesis absorbs energy from light and is an endothermic chemical process.

4188. Steam reforming of methane requires strong heat input and is endothermic.

4189. Dissolving ammonium nitrate in water absorbs heat, so the temperature of the mixture decreases.

4190. Dissolving potassium nitrate in water absorbs heat from the surroundings and causes cooling.

4191. Dissolving ammonium chloride in water is endothermic and makes the solution colder.

4192. Evaporation of water from a surface absorbs heat and lowers the surface temperature.

4193. Evaporation of ethanol absorbs heat from the surroundings and creates cooling.

4194. Melting ice absorbs heat and reduces the temperature of nearby materials.

4195. Sublimation of dry ice absorbs heat and cools the surrounding air.

4196. Thermal decomposition of calcium carbonate requires heat input and is endothermic.

4197. Thermal decomposition of copper carbonate needs heat and causes a temperature drop in the reacting zone if heat is not continuously supplied.

4198. Electrolysis of water requires energy input and behaves as an endothermic process.

4199. Photosynthesis absorbs energy from light and is an endothermic chemical process.

4200. Steam reforming of methane requires strong heat input and is endothermic.

4201. Dissolving ammonium nitrate in water absorbs heat, so the temperature of the mixture decreases.

4202. Dissolving potassium nitrate in water absorbs heat from the surroundings and causes cooling.

4203. Dissolving ammonium chloride in water is endothermic and makes the solution colder.

4204. Evaporation of water from a surface absorbs heat and lowers the surface temperature.

4205. Evaporation of ethanol absorbs heat from the surroundings and creates cooling.

4206. Melting ice absorbs heat and reduces the temperature of nearby materials.

4207. Sublimation of dry ice absorbs heat and cools the surrounding air.

4208. Thermal decomposition of calcium carbonate requires heat input and is endothermic.

4209. Thermal decomposition of copper carbonate needs heat and causes a temperature drop in the reacting zone if heat is not continuously supplied.

4210. Electrolysis of water requires energy input and behaves as an endothermic process.

4211. Photosynthesis absorbs energy from light and is an endothermic chemical process.

4212. Steam reforming of methane requires strong heat input and is endothermic.

4213. Dissolving ammonium nitrate in water absorbs heat, so the temperature of the mixture decreases.

4214. Dissolving potassium nitrate in water absorbs heat from the surroundings and causes cooling.

4215. Dissolving ammonium chloride in water is endothermic and makes the solution colder.

4216. Evaporation of water from a surface absorbs heat and lowers the surface temperature.

4217. Evaporation of ethanol absorbs heat from the surroundings and creates cooling.

4218. Melting ice absorbs heat and reduces the temperature of nearby materials.

4219. Sublimation of dry ice absorbs heat and cools the surrounding air.

4220. Thermal decomposition of calcium carbonate requires heat input and is endothermic.

4221. Thermal decomposition of copper carbonate needs heat and causes a temperature drop in the reacting zone if heat is not continuously supplied.

4222. Electrolysis of water requires energy input and behaves as an endothermic process.

4223. Photosynthesis absorbs energy from light and is an endothermic chemical process.

4224. Steam reforming of methane requires strong heat input and is endothermic.

4225. Dissolving ammonium nitrate in water absorbs heat, so the temperature of the mixture decreases.

4358. Dissolving potassium nitrate in water absorbs heat from the surroundings and causes cooling.
4359. Dissolving ammonium chloride in water is endothermic and makes the solution colder.
4360. Evaporation of water from a surface absorbs heat and lowers the surface temperature.
4361. Evaporation of ethanol absorbs heat from the surroundings and creates cooling.
4362. Melting ice absorbs heat and reduces the temperature of nearby materials.
4363. Sublimation of dry ice absorbs heat and cools the surrounding air.
4364. Thermal decomposition of calcium carbonate requires heat input and is endothermic.
4365. Thermal decomposition of copper carbonate needs heat and causes a temperature drop in the reacting zone if heat is not continuously supplied.
4366. Electrolysis of water requires energy input and behaves as an endothermic process.
4367. Photosynthesis absorbs energy from light and is an endothermic chemical process.
4368. Steam reforming of methane requires strong heat input and is endothermic.
4369. Dissolving ammonium nitrate in water absorbs heat, so the temperature of the mixture decreases.
4370. Dissolving potassium nitrate in water absorbs heat from the surroundings and causes cooling.
4371. Dissolving ammonium chloride in water is endothermic and makes the solution colder.
4372. Evaporation of water from a surface absorbs heat and lowers the surface temperature.
4373. Evaporation of ethanol absorbs heat from the surroundings and creates cooling.
4374. Melting ice absorbs heat and reduces the temperature of nearby materials.
4375. Sublimation of dry ice absorbs heat and cools the surrounding air.
4376. Thermal decomposition of calcium carbonate requires heat input and is endothermic.
4377. Thermal decomposition of copper carbonate needs heat and causes a temperature drop in the reacting zone if heat is not continuously supplied.
4378. Electrolysis of water requires energy input and behaves as an endothermic process.
4379. Photosynthesis absorbs energy from light and is an endothermic chemical process.
4380. Steam reforming of methane requires strong heat input and is endothermic.
4381. Dissolving ammonium nitrate in water absorbs heat, so the temperature of the mixture decreases.
4382. Dissolving potassium nitrate in water absorbs heat from the surroundings and causes cooling.
4383. Dissolving ammonium chloride in water is endothermic and makes the solution colder.
4384. Evaporation of water from a surface absorbs heat and lowers the surface temperature.
4385. Evaporation of ethanol absorbs heat from the surroundings and creates cooling.
4386. Melting ice absorbs heat and reduces the temperature of nearby materials.
4387. Sublimation of dry ice absorbs heat and cools the surrounding air.
4388. Thermal decomposition of calcium carbonate requires heat input and is endothermic.
4389. Thermal decomposition of copper carbonate needs heat and causes a temperature drop in the reacting zone if heat is not continuously supplied.
4390. Electrolysis of water requires energy input and behaves as an endothermic process.
4391. Photosynthesis absorbs energy from light and is an endothermic chemical process.
4392. Steam reforming of methane requires strong heat input and is endothermic.
4393. Dissolving ammonium nitrate in water absorbs heat, so the temperature of the mixture decreases.
4394. Dissolving potassium nitrate in water absorbs heat from the surroundings and causes cooling.
4395. Dissolving ammonium chloride in water is endothermic and makes the solution colder.
4396. Evaporation of water from a surface absorbs heat and lowers the surface temperature.
4397. Evaporation of ethanol absorbs heat from the surroundings and creates cooling.
4398. Melting ice absorbs heat and reduces the temperature of nearby materials.
4399. Sublimation of dry ice absorbs heat and cools the surrounding air.
4400. Thermal decomposition of calcium carbonate requires heat input and is endothermic.
4401. Thermal decomposition of copper carbonate needs heat and causes a temperature drop in the reacting zone if heat is not continuously supplied.

4446. Melting ice absorbs heat and reduces the temperature of nearby materials.

4447. Sublimation of dry ice absorbs heat and cools the surrounding air.

4448. Thermal decomposition of calcium carbonate requires heat input and is endothermic.

4449. Thermal decomposition of copper carbonate needs heat and causes a temperature drop in the reacting zone if heat is not continuously supplied.

4450. Electrolysis of water requires energy input and behaves as an endothermic process.

4451. Photosynthesis absorbs energy from light and is an endothermic chemical process.

4452. Steam reforming of methane requires strong heat input and is endothermic.

4453. Dissolving ammonium nitrate in water absorbs heat, so the temperature of the mixture decreases.

4454. Dissolving potassium nitrate in water absorbs heat from the surroundings and causes cooling.

4455. Dissolving ammonium chloride in water is endothermic and makes the solution colder.

4456. Evaporation of water from a surface absorbs heat and lowers the surface temperature.

4457. Evaporation of ethanol absorbs heat from the surroundings and creates cooling.

4458. Melting ice absorbs heat and reduces the temperature of nearby materials.

4459. Sublimation of dry ice absorbs heat and cools the surrounding air.

4460. Thermal decomposition of calcium carbonate requires heat input and is endothermic.

4461. Thermal decomposition of copper carbonate needs heat and causes a temperature drop in the reacting zone if heat is not continuously supplied.

4462. Electrolysis of water requires energy input and behaves as an endothermic process.

4463. Photosynthesis absorbs energy from light and is an endothermic chemical process.

4464. Steam reforming of methane requires strong heat input and is endothermic.

4465. Dissolving ammonium nitrate in water absorbs heat, so the temperature of the mixture decreases.

4466. Dissolving potassium nitrate in water absorbs heat from the surroundings and causes cooling.

4467. Dissolving ammonium chloride in water is endothermic and makes the solution colder.

4468. Evaporation of water from a surface absorbs heat and lowers the surface temperature.

4469. Evaporation of ethanol absorbs heat from the surroundings and creates cooling.

4470. Melting ice absorbs heat and reduces the temperature of nearby materials.

4471. Sublimation of dry ice absorbs heat and cools the surrounding air.

4472. Thermal decomposition of calcium carbonate requires heat input and is endothermic.

4473. Thermal decomposition of copper carbonate needs heat and causes a temperature drop in the reacting zone if heat is not continuously supplied.

4474. Electrolysis of water requires energy input and behaves as an endothermic process.

4475. Photosynthesis absorbs energy from light and is an endothermic chemical process.

4476. Steam reforming of methane requires strong heat input and is endothermic.

4477. Dissolving ammonium nitrate in water absorbs heat, so the temperature of the mixture decreases.

4478. Dissolving potassium nitrate in water absorbs heat from the surroundings and causes cooling.

4479. Dissolving ammonium chloride in water is endothermic and makes the solution colder.

4480. Evaporation of water from a surface absorbs heat and lowers the surface temperature.

4481. Evaporation of ethanol absorbs heat from the surroundings and creates cooling.

4482. Melting ice absorbs heat and reduces the temperature of nearby materials.

4483. Sublimation of dry ice absorbs heat and cools the surrounding air.

4484. Thermal decomposition of calcium carbonate requires heat input and is endothermic.

4485. Thermal decomposition of copper carbonate needs heat and causes a temperature drop in the reacting zone if heat is not continuously supplied.

4486. Electrolysis of water requires energy input and behaves as an endothermic process.

4487. Photosynthesis absorbs energy from light and is an endothermic chemical process.

4488. Steam reforming of methane requires strong heat input and is endothermic.

4489. Dissolving ammonium nitrate in water absorbs heat, so the temperature of the mixture decreases.

4622. Dissolving ammonium nitrate in water absorbs heat from the surroundings and causes cooling.

4623. Dissolving ammonium chloride in water is endothermic and makes the solution colder.

4624. Evaporation of water from a surface absorbs heat and lowers the surface temperature.

4625. Evaporation of ethanol absorbs heat from the surroundings and creates cooling.

4626. Melting ice absorbs heat and reduces the temperature of nearby materials.

4627. Sublimation of dry ice absorbs heat and cools the surrounding air.

4628. Thermal decomposition of calcium carbonate requires heat input and is endothermic.

4629. Thermal decomposition of copper carbonate needs heat and causes a temperature drop in the reacting zone if heat is not continuously supplied.

4630. Electrolysis of water requires energy input and behaves as an endothermic process.

4631. Photosynthesis absorbs energy from light and is an endothermic chemical process.

4632. Steam reforming of methane requires strong heat input and is endothermic.

4633. Dissolving ammonium nitrate in water absorbs heat, so the temperature of the mixture decreases.

4634. Dissolving potassium nitrate in water absorbs heat from the surroundings and causes cooling.

4635. Dissolving ammonium chloride in water is endothermic and makes the solution colder.

4636. Evaporation of water from a surface absorbs heat and lowers the surface temperature.

4637. Evaporation of ethanol absorbs heat from the surroundings and creates cooling.

4638. Melting ice absorbs heat and reduces the temperature of nearby materials.

4639. Sublimation of dry ice absorbs heat and cools the surrounding air.

4640. Thermal decomposition of calcium carbonate requires heat input and is endothermic.

4641. Thermal decomposition of copper carbonate needs heat and causes a temperature drop in the reacting zone if heat is not continuously supplied.

4642. Electrolysis of water requires energy input and behaves as an endothermic process.

4643. Photosynthesis absorbs energy from light and is an endothermic chemical process.

4644. Steam reforming of methane requires strong heat input and is endothermic.

4645. Dissolving ammonium nitrate in water absorbs heat, so the temperature of the mixture decreases.

4646. Dissolving potassium nitrate in water absorbs heat from the surroundings and causes cooling.

4647. Dissolving ammonium chloride in water is endothermic and makes the solution colder.

4648. Evaporation of water from a surface absorbs heat and lowers the surface temperature.

4649. Evaporation of ethanol absorbs heat from the surroundings and creates cooling.

4650. Melting ice absorbs heat and reduces the temperature of nearby materials.

4651. Sublimation of dry ice absorbs heat and cools the surrounding air.

4652. Thermal decomposition of calcium carbonate requires heat input and is endothermic.

4653. Thermal decomposition of copper carbonate needs heat and causes a temperature drop in the reacting zone if heat is not continuously supplied.

4654. Electrolysis of water requires energy input and behaves as an endothermic process.

4655. Photosynthesis absorbs energy from light and is an endothermic chemical process.

4656. Steam reforming of methane requires strong heat input and is endothermic.

4657. Dissolving ammonium nitrate in water absorbs heat, so the temperature of the mixture decreases.

4658. Dissolving potassium nitrate in water absorbs heat from the surroundings and causes cooling.

4659. Dissolving ammonium chloride in water is endothermic and makes the solution colder.

4660. Evaporation of water from a surface absorbs heat and lowers the surface temperature.

4661. Evaporation of ethanol absorbs heat from the surroundings and creates cooling.

4662. Melting ice absorbs heat and reduces the temperature of nearby materials.

4663. Sublimation of dry ice absorbs heat and cools the surrounding air.

4664. Thermal decomposition of calcium carbonate requires heat input and is endothermic.

4665. Thermal decomposition of copper carbonate needs heat and causes a temperature drop in the reacting zone if heat is not continuously supplied.

4710. Melting ice absorbs heat and reduces the temperature of nearby materials.

4711. Sublimation of dry ice absorbs heat and cools the surrounding air.

4712. Thermal decomposition of calcium carbonate requires heat input and is endothermic.

4713. Thermal decomposition of copper carbonate needs heat and causes a temperature drop in the reacting zone if heat is not continuously supplied.

4714. Electrolysis of water requires energy input and behaves as an endothermic process.

4715. Photosynthesis absorbs energy from light and is an endothermic chemical process.

4716. Steam reforming of methane requires strong heat input and is endothermic.

4717. Dissolving ammonium nitrate in water absorbs heat, so the temperature of the mixture decreases.

4718. Dissolving potassium nitrate in water absorbs heat from the surroundings and causes cooling.

4719. Dissolving ammonium chloride in water is endothermic and makes the solution colder.

4720. Evaporation of water from a surface absorbs heat and lowers the surface temperature.

4721. Evaporation of ethanol absorbs heat from the surroundings and creates cooling.

4722. Melting ice absorbs heat and reduces the temperature of nearby materials.

4723. Sublimation of dry ice absorbs heat and cools the surrounding air.

4724. Thermal decomposition of calcium carbonate requires heat input and is endothermic.

4725. Thermal decomposition of copper carbonate needs heat and causes a temperature drop in the reacting zone if heat is not continuously supplied.

4726. Electrolysis of water requires energy input and behaves as an endothermic process.

4727. Photosynthesis absorbs energy from light and is an endothermic chemical process.

4728. Steam reforming of methane requires strong heat input and is endothermic.

4729. Dissolving ammonium nitrate in water absorbs heat, so the temperature of the mixture decreases.

4730. Dissolving potassium nitrate in water absorbs heat from the surroundings and causes cooling.

4731. Dissolving ammonium chloride in water is endothermic and makes the solution colder.

4732. Evaporation of water from a surface absorbs heat and lowers the surface temperature.

4733. Evaporation of ethanol absorbs heat from the surroundings and creates cooling.

4734. Melting ice absorbs heat and reduces the temperature of nearby materials.

4735. Sublimation of dry ice absorbs heat and cools the surrounding air.

4736. Thermal decomposition of calcium carbonate requires heat input and is endothermic.

4737. Thermal decomposition of copper carbonate needs heat and causes a temperature drop in the reacting zone if heat is not continuously supplied.

4738. Electrolysis of water requires energy input and behaves as an endothermic process.

4739. Photosynthesis absorbs energy from light and is an endothermic chemical process.

4740. Steam reforming of methane requires strong heat input and is endothermic.

4741. Dissolving ammonium nitrate in water absorbs heat, so the temperature of the mixture decreases.

4742. Dissolving potassium nitrate in water absorbs heat from the surroundings and causes cooling.

4743. Dissolving ammonium chloride in water is endothermic and makes the solution colder.

4744. Evaporation of water from a surface absorbs heat and lowers the surface temperature.

4745. Evaporation of ethanol absorbs heat from the surroundings and creates cooling.

4746. Melting ice absorbs heat and reduces the temperature of nearby materials.

4747. Sublimation of dry ice absorbs heat and cools the surrounding air.

4748. Thermal decomposition of calcium carbonate requires heat input and is endothermic.

4749. Thermal decomposition of copper carbonate needs heat and causes a temperature drop in the reacting zone if heat is not continuously supplied.

4750. Electrolysis of water requires energy input and behaves as an endothermic process.

4751. Photosynthesis absorbs energy from light and is an endothermic chemical process.

4752. Steam reforming of methane requires strong heat input and is endothermic.

4753. Dissolving ammonium nitrate in water absorbs heat, so the temperature of the mixture decreases.

4886. Dissolving potassium nitrate in water absorbs heat from the surroundings and causes cooling.

4887. Dissolving ammonium chloride in water is endothermic and makes the solution colder.

4888. Evaporation of water from a surface absorbs heat and lowers the surface temperature.

4889. Evaporation of ethanol absorbs heat from the surroundings and creates cooling.

4890. Melting ice absorbs heat and reduces the temperature of nearby materials.

4891. Sublimation of dry ice absorbs heat and cools the surrounding air.

4892. Thermal decomposition of calcium carbonate requires heat input and is endothermic.

4893. Thermal decomposition of copper carbonate needs heat and causes a temperature drop in the reacting zone if heat is not continuously supplied.

4894. Electrolysis of water requires energy input and behaves as an endothermic process.

4895. Photosynthesis absorbs energy from light and is an endothermic chemical process.

4896. Steam reforming of methane requires strong heat input and is endothermic.

4897. Dissolving ammonium nitrate in water absorbs heat, so the temperature of the mixture decreases.

4898. Dissolving potassium nitrate in water absorbs heat from the surroundings and causes cooling.

4899. Dissolving ammonium chloride in water is endothermic and makes the solution colder.

4900. Evaporation of water from a surface absorbs heat and lowers the surface temperature.

4901. Evaporation of ethanol absorbs heat from the surroundings and creates cooling.

4902. Melting ice absorbs heat and reduces the temperature of nearby materials.

4903. Sublimation of dry ice absorbs heat and cools the surrounding air.

4904. Thermal decomposition of calcium carbonate requires heat input and is endothermic.

4905. Thermal decomposition of copper carbonate needs heat and causes a temperature drop in the reacting zone if heat is not continuously supplied.

4906. Electrolysis of water requires energy input and behaves as an endothermic process.

4907. Photosynthesis absorbs energy from light and is an endothermic chemical process.

4908. Steam reforming of methane requires strong heat input and is endothermic.

4909. Dissolving ammonium nitrate in water absorbs heat, so the temperature of the mixture decreases.

4910. Dissolving potassium nitrate in water absorbs heat from the surroundings and causes cooling.

4911. Dissolving ammonium chloride in water is endothermic and makes the solution colder.

4912. Evaporation of water from a surface absorbs heat and lowers the surface temperature.

4913. Evaporation of ethanol absorbs heat from the surroundings and creates cooling.

4914. Melting ice absorbs heat and reduces the temperature of nearby materials.

4915. Sublimation of dry ice absorbs heat and cools the surrounding air.

4916. Thermal decomposition of calcium carbonate requires heat input and is endothermic.

4917. Thermal decomposition of copper carbonate needs heat and causes a temperature drop in the reacting zone if heat is not continuously supplied.

4918. Electrolysis of water requires energy input and behaves as an endothermic process.

4919. Photosynthesis absorbs energy from light and is an endothermic chemical process.

4920. Steam reforming of methane requires strong heat input and is endothermic.

4921. Dissolving ammonium nitrate in water absorbs heat, so the temperature of the mixture decreases.

4922. Dissolving potassium nitrate in water absorbs heat from the surroundings and causes cooling.

4923. Dissolving ammonium chloride in water is endothermic and makes the solution colder.

4924. Evaporation of water from a surface absorbs heat and lowers the surface temperature.

4925. Evaporation of ethanol absorbs heat from the surroundings and creates cooling.

4926. Melting ice absorbs heat and reduces the temperature of nearby materials.

4927. Sublimation of dry ice absorbs heat and cools the surrounding air.

4928. Thermal decomposition of calcium carbonate requires heat input and is endothermic.

4929. Thermal decomposition of copper carbonate needs heat and causes a temperature drop in the reacting zone if heat is not continuously supplied.

5150. Dissolving potassium nitrate in water absorbs heat from the surroundings and causes cooling.
5151. Dissolving ammonium chloride in water is endothermic and makes the solution colder.
5152. Evaporation of water from a surface absorbs heat and lowers the surface temperature.
5153. Evaporation of ethanol absorbs heat from the surroundings and creates cooling.
5154. Melting ice absorbs heat and reduces the temperature of nearby materials.
5155. Sublimation of dry ice absorbs heat and cools the surrounding air.
5156. Thermal decomposition of calcium carbonate requires heat input and is endothermic.
5157. Thermal decomposition of copper carbonate needs heat and causes a temperature drop in the reacting zone if heat is not continuously supplied.
5158. Electrolysis of water requires energy input and behaves as an endothermic process.
5159. Photosynthesis absorbs energy from light and is an endothermic chemical process.
5160. Steam reforming of methane requires strong heat input and is endothermic.
5161. Dissolving ammonium nitrate in water absorbs heat, so the temperature of the mixture decreases.
5162. Dissolving potassium nitrate in water absorbs heat from the surroundings and causes cooling.
5163. Dissolving ammonium chloride in water is endothermic and makes the solution colder.
5164. Evaporation of water from a surface absorbs heat and lowers the surface temperature.
5165. Evaporation of ethanol absorbs heat from the surroundings and creates cooling.
5166. Melting ice absorbs heat and reduces the temperature of nearby materials.
5167. Sublimation of dry ice absorbs heat and cools the surrounding air.
5168. Thermal decomposition of calcium carbonate requires heat input and is endothermic.
5169. Thermal decomposition of copper carbonate needs heat and causes a temperature drop in the reacting zone if heat is not continuously supplied.
5170. Electrolysis of water requires energy input and behaves as an endothermic process.
5171. Photosynthesis absorbs energy from light and is an endothermic chemical process.
5172. Steam reforming of methane requires strong heat input and is endothermic.
5173. Dissolving ammonium nitrate in water absorbs heat, so the temperature of the mixture decreases.
5174. Dissolving potassium nitrate in water absorbs heat from the surroundings and causes cooling.
5175. Dissolving ammonium chloride in water is endothermic and makes the solution colder.
5176. Evaporation of water from a surface absorbs heat and lowers the surface temperature.
5177. Evaporation of ethanol absorbs heat from the surroundings and creates cooling.
5178. Melting ice absorbs heat and reduces the temperature of nearby materials.
5179. Sublimation of dry ice absorbs heat and cools the surrounding air.
5180. Thermal decomposition of calcium carbonate requires heat input and is endothermic.
5181. Thermal decomposition of copper carbonate needs heat and causes a temperature drop in the reacting zone if heat is not continuously supplied.
5182. Electrolysis of water requires energy input and behaves as an endothermic process.
5183. Photosynthesis absorbs energy from light and is an endothermic chemical process.
5184. Steam reforming of methane requires strong heat input and is endothermic.
5185. Dissolving ammonium nitrate in water absorbs heat, so the temperature of the mixture decreases.
5186. Dissolving potassium nitrate in water absorbs heat from the surroundings and causes cooling.
5187. Dissolving ammonium chloride in water is endothermic and makes the solution colder.
5188. Evaporation of water from a surface absorbs heat and lowers the surface temperature.
5189. Evaporation of ethanol absorbs heat from the surroundings and creates cooling.
5190. Melting ice absorbs heat and reduces the temperature of nearby materials.
5191. Sublimation of dry ice absorbs heat and cools the surrounding air.
5192. Thermal decomposition of calcium carbonate requires heat input and is endothermic.
5193. Thermal decomposition of copper carbonate needs heat and causes a temperature drop in the reacting zone if heat is not continuously supplied.

5238. Melting ice absorbs heat and reduces the temperature of nearby materials.

5239. Sublimation of dry ice absorbs heat and cools the surrounding air.

5240. Thermal decomposition of calcium carbonate requires heat input and is endothermic.

5241. Thermal decomposition of copper carbonate needs heat and causes a temperature drop in the reacting zone if heat is not continuously supplied.

5242. Electrolysis of water requires energy input and behaves as an endothermic process.

5243. Photosynthesis absorbs energy from light and is an endothermic chemical process.

5244. Steam reforming of methane requires strong heat input and is endothermic.

5245. Dissolving ammonium nitrate in water absorbs heat, so the temperature of the mixture decreases.

5246. Dissolving potassium nitrate in water absorbs heat from the surroundings and causes cooling.

5247. Dissolving ammonium chloride in water is endothermic and makes the solution colder.

5248. Evaporation of water from a surface absorbs heat and lowers the surface temperature.

5249. Evaporation of ethanol absorbs heat from the surroundings and creates cooling.

5250. Melting ice absorbs heat and reduces the temperature of nearby materials.

5251. Sublimation of dry ice absorbs heat and cools the surrounding air.

5252. Thermal decomposition of calcium carbonate requires heat input and is endothermic.

5253. Thermal decomposition of copper carbonate needs heat and causes a temperature drop in the reacting zone if heat is not continuously supplied.

5254. Electrolysis of water requires energy input and behaves as an endothermic process.

5255. Photosynthesis absorbs energy from light and is an endothermic chemical process.

5256. Steam reforming of methane requires strong heat input and is endothermic.

5257. Dissolving ammonium nitrate in water absorbs heat, so the temperature of the mixture decreases.

5258. Dissolving potassium nitrate in water absorbs heat from the surroundings and causes cooling.

5259. Dissolving ammonium chloride in water is endothermic and makes the solution colder.

5260. Evaporation of water from a surface absorbs heat and lowers the surface temperature.

5261. Evaporation of ethanol absorbs heat from the surroundings and creates cooling.

5262. Melting ice absorbs heat and reduces the temperature of nearby materials.

5263. Sublimation of dry ice absorbs heat and cools the surrounding air.

5264. Thermal decomposition of calcium carbonate requires heat input and is endothermic.

5265. Thermal decomposition of copper carbonate needs heat and causes a temperature drop in the reacting zone if heat is not continuously supplied.

5266. Electrolysis of water requires energy input and behaves as an endothermic process.

5267. Photosynthesis absorbs energy from light and is an endothermic chemical process.

5268. Steam reforming of methane requires strong heat input and is endothermic.

5269. Dissolving ammonium nitrate in water absorbs heat, so the temperature of the mixture decreases.

5270. Dissolving potassium nitrate in water absorbs heat from the surroundings and causes cooling.

5271. Dissolving ammonium chloride in water is endothermic and makes the solution colder.

5272. Evaporation of water from a surface absorbs heat and lowers the surface temperature.

5273. Evaporation of ethanol absorbs heat from the surroundings and creates cooling.

5274. Melting ice absorbs heat and reduces the temperature of nearby materials.

5275. Sublimation of dry ice absorbs heat and cools the surrounding air.

5276. Thermal decomposition of calcium carbonate requires heat input and is endothermic.

5277. Thermal decomposition of copper carbonate needs heat and causes a temperature drop in the reacting zone if heat is not continuously supplied.

5278. Electrolysis of water requires energy input and behaves as an endothermic process.

5279. Photosynthesis absorbs energy from light and is an endothermic chemical process.

5280. Steam reforming of methane requires strong heat input and is endothermic.

5281. Dissolving ammonium nitrate in water absorbs heat, so the temperature of the mixture decreases.

5502. Melting ice absorbs heat and reduces the temperature of nearby materials.

5503. Sublimation of dry ice absorbs heat and cools the surrounding air.

5504. Thermal decomposition of calcium carbonate requires heat input and is endothermic.

5505. Thermal decomposition of copper carbonate needs heat and causes a temperature drop in the reacting zone if heat is not continuously supplied.

5506. Electrolysis of water requires energy input and behaves as an endothermic process.

5507. Photosynthesis absorbs energy from light and is an endothermic chemical process.

5508. Steam reforming of methane requires strong heat input and is endothermic.

5509. Dissolving ammonium nitrate in water absorbs heat, so the temperature of the mixture decreases.

5510. Dissolving potassium nitrate in water absorbs heat from the surroundings and causes cooling.

5511. Dissolving ammonium chloride in water is endothermic and makes the solution colder.

5512. Evaporation of water from a surface absorbs heat and lowers the surface temperature.

5513. Evaporation of ethanol absorbs heat from the surroundings and creates cooling.

5514. Melting ice absorbs heat and reduces the temperature of nearby materials.

5515. Sublimation of dry ice absorbs heat and cools the surrounding air.

5516. Thermal decomposition of calcium carbonate requires heat input and is endothermic.

5517. Thermal decomposition of copper carbonate needs heat and causes a temperature drop in the reacting zone if heat is not continuously supplied.

5518. Electrolysis of water requires energy input and behaves as an endothermic process.

5519. Photosynthesis absorbs energy from light and is an endothermic chemical process.

5520. Steam reforming of methane requires strong heat input and is endothermic.

5521. Dissolving ammonium nitrate in water absorbs heat, so the temperature of the mixture decreases.

5522. Dissolving potassium nitrate in water absorbs heat from the surroundings and causes cooling.

5523. Dissolving ammonium chloride in water is endothermic and makes the solution colder.

5524. Evaporation of water from a surface absorbs heat and lowers the surface temperature.

5525. Evaporation of ethanol absorbs heat from the surroundings and creates cooling.

5526. Melting ice absorbs heat and reduces the temperature of nearby materials.

5527. Sublimation of dry ice absorbs heat and cools the surrounding air.

5528. Thermal decomposition of calcium carbonate requires heat input and is endothermic.

5529. Thermal decomposition of copper carbonate needs heat and causes a temperature drop in the reacting zone if heat is not continuously supplied.

5530. Electrolysis of water requires energy input and behaves as an endothermic process.

5531. Photosynthesis absorbs energy from light and is an endothermic chemical process.

5532. Steam reforming of methane requires strong heat input and is endothermic.

5533. Dissolving ammonium nitrate in water absorbs heat, so the temperature of the mixture decreases.

5534. Dissolving potassium nitrate in water absorbs heat from the surroundings and causes cooling.

5535. Dissolving ammonium chloride in water is endothermic and makes the solution colder.

5536. Evaporation of water from a surface absorbs heat and lowers the surface temperature.

5537. Evaporation of ethanol absorbs heat from the surroundings and creates cooling.

5538. Melting ice absorbs heat and reduces the temperature of nearby materials.

5539. Sublimation of dry ice absorbs heat and cools the surrounding air.

5540. Thermal decomposition of calcium carbonate requires heat input and is endothermic.

5541. Thermal decomposition of copper carbonate needs heat and causes a temperature drop in the reacting zone if heat is not continuously supplied.

5542. Electrolysis of water requires energy input and behaves as an endothermic process.

5543. Photosynthesis absorbs energy from light and is an endothermic chemical process.

5544. Steam reforming of methane requires strong heat input and is endothermic.

5545. Dissolving ammonium nitrate in water absorbs heat, so the temperature of the mixture decreases.

5590. Electrolysis of water requires energy input and behaves as an endothermic process.

5591. Photosynthesis absorbs energy from light and is an endothermic chemical process.

5592. Steam reforming of methane requires strong heat input and is endothermic.

5593. Dissolving ammonium nitrate in water absorbs heat, so the temperature of the mixture decreases.

5594. Dissolving potassium nitrate in water absorbs heat from the surroundings and causes cooling.

5595. Dissolving ammonium chloride in water is endothermic and makes the solution colder.

5596. Evaporation of water from a surface absorbs heat and lowers the surface temperature.

5597. Evaporation of ethanol absorbs heat from the surroundings and creates cooling.

5598. Melting ice absorbs heat and reduces the temperature of nearby materials.

5599. Sublimation of dry ice absorbs heat and cools the surrounding air.

5600. Thermal decomposition of calcium carbonate requires heat input and is endothermic.

5601. Thermal decomposition of copper carbonate needs heat and causes a temperature drop in the reacting zone if heat is not continuously supplied.

5602. Electrolysis of water requires energy input and behaves as an endothermic process.

5603. Photosynthesis absorbs energy from light and is an endothermic chemical process.

5604. Steam reforming of methane requires strong heat input and is endothermic.

5605. Dissolving ammonium nitrate in water absorbs heat, so the temperature of the mixture decreases.

5606. Dissolving potassium nitrate in water absorbs heat from the surroundings and causes cooling.

5607. Dissolving ammonium chloride in water is endothermic and makes the solution colder.

5608. Evaporation of water from a surface absorbs heat and lowers the surface temperature.

5609. Evaporation of ethanol absorbs heat from the surroundings and creates cooling.

5610. Melting ice absorbs heat and reduces the temperature of nearby materials.

5611. Sublimation of dry ice absorbs heat and cools the surrounding air.

5612. Thermal decomposition of calcium carbonate requires heat input and is endothermic.

5613. Thermal decomposition of copper carbonate needs heat and causes a temperature drop in the reacting zone if heat is not continuously supplied.

5614. Electrolysis of water requires energy input and behaves as an endothermic process.

5615. Photosynthesis absorbs energy from light and is an endothermic chemical process.

5616. Steam reforming of methane requires strong heat input and is endothermic.

5617. Dissolving ammonium nitrate in water absorbs heat, so the temperature of the mixture decreases.

5618. Dissolving potassium nitrate in water absorbs heat from the surroundings and causes cooling.

5619. Dissolving ammonium chloride in water is endothermic and makes the solution colder.

5620. Evaporation of water from a surface absorbs heat and lowers the surface temperature.

5621. Evaporation of ethanol absorbs heat from the surroundings and creates cooling.

5622. Melting ice absorbs heat and reduces the temperature of nearby materials.

5623. Sublimation of dry ice absorbs heat and cools the surrounding air.

5624. Thermal decomposition of calcium carbonate requires heat input and is endothermic.

5625. Thermal decomposition of copper carbonate needs heat and causes a temperature drop in the reacting zone if heat is not continuously supplied.

5626. Electrolysis of water requires energy input and behaves as an endothermic process.

5627. Photosynthesis absorbs energy from light and is an endothermic chemical process.

5628. Steam reforming of methane requires strong heat input and is endothermic.

5629. Dissolving ammonium nitrate in water absorbs heat, so the temperature of the mixture decreases.

5630. Dissolving potassium nitrate in water absorbs heat from the surroundings and causes cooling.

5631. Dissolving ammonium chloride in water is endothermic and makes the solution colder.

5632. Evaporation of water from a surface absorbs heat and lowers the surface temperature.

5633. Evaporation of ethanol absorbs heat from the surroundings and creates cooling.

3721: Thermal decomposition of copper carbonate needs heat and causes a temperature drop in the reacting zone if heat is not continuously supplied.

5766. Melting ice absorbs heat and reduces the temperature of nearby materials.

5767. Sublimation of dry ice absorbs heat and cools the surrounding air.

5768. Thermal decomposition of calcium carbonate requires heat input and is endothermic.

5769. Thermal decomposition of copper carbonate needs heat and causes a temperature drop in the reacting zone if heat is not continuously supplied.

5770. Electrolysis of water requires energy input and behaves as an endothermic process.

5771. Photosynthesis absorbs energy from light and is an endothermic chemical process.

5772. Steam reforming of methane requires strong heat input and is endothermic.

5773. Dissolving ammonium nitrate in water absorbs heat, so the temperature of the mixture decreases.

5774. Dissolving potassium nitrate in water absorbs heat from the surroundings and causes cooling.

5775. Dissolving ammonium chloride in water is endothermic and makes the solution colder.

5776. Evaporation of water from a surface absorbs heat and lowers the surface temperature.

5777. Evaporation of ethanol absorbs heat from the surroundings and creates cooling.

5778. Melting ice absorbs heat and reduces the temperature of nearby materials.

5779. Sublimation of dry ice absorbs heat and cools the surrounding air.

5780. Thermal decomposition of calcium carbonate requires heat input and is endothermic.

5781. Thermal decomposition of copper carbonate needs heat and causes a temperature drop in the reacting zone if heat is not continuously supplied.

5782. Electrolysis of water requires energy input and behaves as an endothermic process.

5783. Photosynthesis absorbs energy from light and is an endothermic chemical process.

5784. Steam reforming of methane requires strong heat input and is endothermic.

5785. Dissolving ammonium nitrate in water absorbs heat, so the temperature of the mixture decreases.

5786. Dissolving potassium nitrate in water absorbs heat from the surroundings and causes cooling.

5787. Dissolving ammonium chloride in water is endothermic and makes the solution colder.

5788. Evaporation of water from a surface absorbs heat and lowers the surface temperature.

5789. Evaporation of ethanol absorbs heat from the surroundings and creates cooling.

5790. Melting ice absorbs heat and reduces the temperature of nearby materials.

5791. Sublimation of dry ice absorbs heat and cools the surrounding air.

5792. Thermal decomposition of calcium carbonate requires heat input and is endothermic.

5793. Thermal decomposition of copper carbonate needs heat and causes a temperature drop in the reacting zone if heat is not continuously supplied.

5794. Electrolysis of water requires energy input and behaves as an endothermic process.

5795. Photosynthesis absorbs energy from light and is an endothermic chemical process.

5796. Steam reforming of methane requires strong heat input and is endothermic.

5797. Dissolving ammonium nitrate in water absorbs heat, so the temperature of the mixture decreases.

5798. Dissolving potassium nitrate in water absorbs heat from the surroundings and causes cooling.

5799. Dissolving ammonium chloride in water is endothermic and makes the solution colder.

5800. Evaporation of water from a surface absorbs heat and lowers the surface temperature.

5801. Evaporation of ethanol absorbs heat from the surroundings and creates cooling.

5802. Melting ice absorbs heat and reduces the temperature of nearby materials.

5803. Sublimation of dry ice absorbs heat and cools the surrounding air.

5804. Thermal decomposition of calcium carbonate requires heat input and is endothermic.

5805. Thermal decomposition of copper carbonate needs heat and causes a temperature drop in the reacting zone if heat is not continuously supplied.

5806. Electrolysis of water requires energy input and behaves as an endothermic process.

5807. Photosynthesis absorbs energy from light and is an endothermic chemical process.

5808. Steam reforming of methane requires strong heat input and is endothermic.

5809. Dissolving ammonium nitrate in water absorbs heat, so the temperature of the mixture decreases.

5942. Dissolving potassium nitrate in water absorbs heat from the surroundings and causes cooling.

5943. Dissolving ammonium chloride in water is endothermic and makes the solution colder.

5944. Evaporation of water from a surface absorbs heat and lowers the surface temperature.

5945. Evaporation of ethanol absorbs heat from the surroundings and creates cooling.

5946. Melting ice absorbs heat and reduces the temperature of nearby materials.

5947. Sublimation of dry ice absorbs heat and cools the surrounding air.

5948. Thermal decomposition of calcium carbonate requires heat input and is endothermic.

5949. Thermal decomposition of copper carbonate needs heat and causes a temperature drop in the reacting zone if heat is not continuously supplied.

5950. Electrolysis of water requires energy input and behaves as an endothermic process.

5951. Photosynthesis absorbs energy from light and is an endothermic chemical process.

5952. Steam reforming of methane requires strong heat input and is endothermic.

5953. Dissolving ammonium nitrate in water absorbs heat, so the temperature of the mixture decreases.

5954. Dissolving potassium nitrate in water absorbs heat from the surroundings and causes cooling.

5955. Dissolving ammonium chloride in water is endothermic and makes the solution colder.

5956. Evaporation of water from a surface absorbs heat and lowers the surface temperature.

5957. Evaporation of ethanol absorbs heat from the surroundings and creates cooling.

5958. Melting ice absorbs heat and reduces the temperature of nearby materials.

5959. Sublimation of dry ice absorbs heat and cools the surrounding air.

5960. Thermal decomposition of calcium carbonate requires heat input and is endothermic.

5961. Thermal decomposition of copper carbonate needs heat and causes a temperature drop in the reacting zone if heat is not continuously supplied.

5962. Electrolysis of water requires energy input and behaves as an endothermic process.

5963. Photosynthesis absorbs energy from light and is an endothermic chemical process.

5964. Steam reforming of methane requires strong heat input and is endothermic.

5965. Dissolving ammonium nitrate in water absorbs heat, so the temperature of the mixture decreases.

5966. Dissolving potassium nitrate in water absorbs heat from the surroundings and causes cooling.

5967. Dissolving ammonium chloride in water is endothermic and makes the solution colder.

5968. Evaporation of water from a surface absorbs heat and lowers the surface temperature.

5969. Evaporation of ethanol absorbs heat from the surroundings and creates cooling.

5970. Melting ice absorbs heat and reduces the temperature of nearby materials.

5971. Sublimation of dry ice absorbs heat and cools the surrounding air.

5972. Thermal decomposition of calcium carbonate requires heat input and is endothermic.

5973. Thermal decomposition of copper carbonate needs heat and causes a temperature drop in the reacting zone if heat is not continuously supplied.

5974. Electrolysis of water requires energy input and behaves as an endothermic process.

5975. Photosynthesis absorbs energy from light and is an endothermic chemical process.

5976. Steam reforming of methane requires strong heat input and is endothermic.

5977. Dissolving ammonium nitrate in water absorbs heat, so the temperature of the mixture decreases.

5978. Dissolving potassium nitrate in water absorbs heat from the surroundings and causes cooling.

5979. Dissolving ammonium chloride in water is endothermic and makes the solution colder.

5980. Evaporation of water from a surface absorbs heat and lowers the surface temperature.

5981. Evaporation of ethanol absorbs heat from the surroundings and creates cooling.

5982. Melting ice absorbs heat and reduces the temperature of nearby materials.

5983. Sublimation of dry ice absorbs heat and cools the surrounding air.

5984. Thermal decomposition of calcium carbonate requires heat input and is endothermic.

5985. Thermal decomposition of copper carbonate needs heat and causes a temperature drop in the reacting zone if heat is not continuously supplied.

6030. Melting ice absorbs heat and reduces the temperature of nearby materials.

6031. Sublimation of dry ice absorbs heat and cools the surrounding air.

6032. Thermal decomposition of calcium carbonate requires heat input and is endothermic.

6033. Thermal decomposition of copper carbonate needs heat and causes a temperature drop in the reacting zone if heat is not continuously supplied.

6034. Electrolysis of water requires energy input and behaves as an endothermic process.

6035. Photosynthesis absorbs energy from light and is an endothermic chemical process.

6036. Steam reforming of methane requires strong heat input and is endothermic.

6037. Dissolving ammonium nitrate in water absorbs heat, so the temperature of the mixture decreases.

6038. Dissolving potassium nitrate in water absorbs heat from the surroundings and causes cooling.

6039. Dissolving ammonium chloride in water is endothermic and makes the solution colder.

6040. Evaporation of water from a surface absorbs heat and lowers the surface temperature.

6041. Evaporation of ethanol absorbs heat from the surroundings and creates cooling.

6042. Melting ice absorbs heat and reduces the temperature of nearby materials.

6043. Sublimation of dry ice absorbs heat and cools the surrounding air.

6044. Thermal decomposition of calcium carbonate requires heat input and is endothermic.

6045. Thermal decomposition of copper carbonate needs heat and causes a temperature drop in the reacting zone if heat is not continuously supplied.

6046. Electrolysis of water requires energy input and behaves as an endothermic process.

6047. Photosynthesis absorbs energy from light and is an endothermic chemical process.

6048. Steam reforming of methane requires strong heat input and is endothermic.

6049. Dissolving ammonium nitrate in water absorbs heat, so the temperature of the mixture decreases.

6050. Dissolving potassium nitrate in water absorbs heat from the surroundings and causes cooling.

6051. Dissolving ammonium chloride in water is endothermic and makes the solution colder.

6052. Evaporation of water from a surface absorbs heat and lowers the surface temperature.

6053. Evaporation of ethanol absorbs heat from the surroundings and creates cooling.

6054. Melting ice absorbs heat and reduces the temperature of nearby materials.

6055. Sublimation of dry ice absorbs heat and cools the surrounding air.

6056. Thermal decomposition of calcium carbonate requires heat input and is endothermic.

6057. Thermal decomposition of copper carbonate needs heat and causes a temperature drop in the reacting zone if heat is not continuously supplied.

6058. Electrolysis of water requires energy input and behaves as an endothermic process.

6059. Photosynthesis absorbs energy from light and is an endothermic chemical process.

6060. Steam reforming of methane requires strong heat input and is endothermic.

6061. Dissolving ammonium nitrate in water absorbs heat, so the temperature of the mixture decreases.

6062. Dissolving potassium nitrate in water absorbs heat from the surroundings and causes cooling.

6063. Dissolving ammonium chloride in water is endothermic and makes the solution colder.

6064. Evaporation of water from a surface absorbs heat and lowers the surface temperature.

6065. Evaporation of ethanol absorbs heat from the surroundings and creates cooling.

6066. Melting ice absorbs heat and reduces the temperature of nearby materials.

6067. Sublimation of dry ice absorbs heat and cools the surrounding air.

6068. Thermal decomposition of calcium carbonate requires heat input and is endothermic.

6069. Thermal decomposition of copper carbonate needs heat and causes a temperature drop in the reacting zone if heat is not continuously supplied.

6070. Electrolysis of water requires energy input and behaves as an endothermic process.

6071. Photosynthesis absorbs energy from light and is an endothermic chemical process.

6072. Steam reforming of methane requires strong heat input and is endothermic.

6073. Dissolving ammonium nitrate in water absorbs heat, so the temperature of the mixture decreases.

6206. Dissolving potassium nitrate in water absorbs heat from the surroundings and causes cooling.
6207. Dissolving ammonium chloride in water is endothermic and makes the solution colder.
6208. Evaporation of water from a surface absorbs heat and lowers the surface temperature.
6209. Evaporation of ethanol absorbs heat from the surroundings and creates cooling.
6210. Melting ice absorbs heat and reduces the temperature of nearby materials.
6211. Sublimation of dry ice absorbs heat and cools the surrounding air.
6212. Thermal decomposition of calcium carbonate requires heat input and is endothermic.
6213. Thermal decomposition of copper carbonate needs heat and causes a temperature drop in the reacting zone if heat is not continuously supplied.
6214. Electrolysis of water requires energy input and behaves as an endothermic process.
6215. Photosynthesis absorbs energy from light and is an endothermic chemical process.
6216. Steam reforming of methane requires strong heat input and is endothermic.
6217. Dissolving ammonium nitrate in water absorbs heat, so the temperature of the mixture decreases.
6218. Dissolving potassium nitrate in water absorbs heat from the surroundings and causes cooling.
6219. Dissolving ammonium chloride in water is endothermic and makes the solution colder.
6220. Evaporation of water from a surface absorbs heat and lowers the surface temperature.
6221. Evaporation of ethanol absorbs heat from the surroundings and creates cooling.
6222. Melting ice absorbs heat and reduces the temperature of nearby materials.
6223. Sublimation of dry ice absorbs heat and cools the surrounding air.
6224. Thermal decomposition of calcium carbonate requires heat input and is endothermic.
6225. Thermal decomposition of copper carbonate needs heat and causes a temperature drop in the reacting zone if heat is not continuously supplied.
6226. Electrolysis of water requires energy input and behaves as an endothermic process.
6227. Photosynthesis absorbs energy from light and is an endothermic chemical process.
6228. Steam reforming of methane requires strong heat input and is endothermic.
6229. Dissolving ammonium nitrate in water absorbs heat, so the temperature of the mixture decreases.
6230. Dissolving potassium nitrate in water absorbs heat from the surroundings and causes cooling.
6231. Dissolving ammonium chloride in water is endothermic and makes the solution colder.
6232. Evaporation of water from a surface absorbs heat and lowers the surface temperature.
6233. Evaporation of ethanol absorbs heat from the surroundings and creates cooling.
6234. Melting ice absorbs heat and reduces the temperature of nearby materials.
6235. Sublimation of dry ice absorbs heat and cools the surrounding air.
6236. Thermal decomposition of calcium carbonate requires heat input and is endothermic.
6237. Thermal decomposition of copper carbonate needs heat and causes a temperature drop in the reacting zone if heat is not continuously supplied.
6238. Electrolysis of water requires energy input and behaves as an endothermic process.
6239. Photosynthesis absorbs energy from light and is an endothermic chemical process.
6240. Steam reforming of methane requires strong heat input and is endothermic.
6241. Dissolving ammonium nitrate in water absorbs heat, so the temperature of the mixture decreases.
6242. Dissolving potassium nitrate in water absorbs heat from the surroundings and causes cooling.
6243. Dissolving ammonium chloride in water is endothermic and makes the solution colder.
6244. Evaporation of water from a surface absorbs heat and lowers the surface temperature.
6245. Evaporation of ethanol absorbs heat from the surroundings and creates cooling.
6246. Melting ice absorbs heat and reduces the temperature of nearby materials.
6247. Sublimation of dry ice absorbs heat and cools the surrounding air.
6248. Thermal decomposition of calcium carbonate requires heat input and is endothermic.
6249. Thermal decomposition of copper carbonate needs heat and causes a temperature drop in the reacting zone if heat is not continuously supplied.

6294. Melting ice absorbs heat and reduces the temperature of nearby materials.

6295. Sublimation of dry ice absorbs heat and cools the surrounding air.

6296. Thermal decomposition of calcium carbonate requires heat input and is endothermic.

6297. Thermal decomposition of copper carbonate needs heat and causes a temperature drop in the reacting zone if heat is not continuously supplied.

6298. Electrolysis of water requires energy input and behaves as an endothermic process.

6299. Photosynthesis absorbs energy from light and is an endothermic chemical process.

6300. Steam reforming of methane requires strong heat input and is endothermic.

6301. Dissolving ammonium nitrate in water absorbs heat, so the temperature of the mixture decreases.

6302. Dissolving potassium nitrate in water absorbs heat from the surroundings and causes cooling.

6303. Dissolving ammonium chloride in water is endothermic and makes the solution colder.

6304. Evaporation of water from a surface absorbs heat and lowers the surface temperature.

6305. Evaporation of ethanol absorbs heat from the surroundings and creates cooling.

6306. Melting ice absorbs heat and reduces the temperature of nearby materials.

6307. Sublimation of dry ice absorbs heat and cools the surrounding air.

6308. Thermal decomposition of calcium carbonate requires heat input and is endothermic.

6309. Thermal decomposition of copper carbonate needs heat and causes a temperature drop in the reacting zone if heat is not continuously supplied.

6310. Electrolysis of water requires energy input and behaves as an endothermic process.

6311. Photosynthesis absorbs energy from light and is an endothermic chemical process.

6312. Steam reforming of methane requires strong heat input and is endothermic.

6313. Dissolving ammonium nitrate in water absorbs heat, so the temperature of the mixture decreases.

6314. Dissolving potassium nitrate in water absorbs heat from the surroundings and causes cooling.

6315. Dissolving ammonium chloride in water is endothermic and makes the solution colder.

6316. Evaporation of water from a surface absorbs heat and lowers the surface temperature.

6317. Evaporation of ethanol absorbs heat from the surroundings and creates cooling.

6318. Melting ice absorbs heat and reduces the temperature of nearby materials.

6319. Sublimation of dry ice absorbs heat and cools the surrounding air.

6320. Thermal decomposition of calcium carbonate requires heat input and is endothermic.

6321. Thermal decomposition of copper carbonate needs heat and causes a temperature drop in the reacting zone if heat is not continuously supplied.

6322. Electrolysis of water requires energy input and behaves as an endothermic process.

6323. Photosynthesis absorbs energy from light and is an endothermic chemical process.

6324. Steam reforming of methane requires strong heat input and is endothermic.

6325. Dissolving ammonium nitrate in water absorbs heat, so the temperature of the mixture decreases.

6326. Dissolving potassium nitrate in water absorbs heat from the surroundings and causes cooling.

6327. Dissolving ammonium chloride in water is endothermic and makes the solution colder.

6328. Evaporation of water from a surface absorbs heat and lowers the surface temperature.

6329. Evaporation of ethanol absorbs heat from the surroundings and creates cooling.

6330. Melting ice absorbs heat and reduces the temperature of nearby materials.

6331. Sublimation of dry ice absorbs heat and cools the surrounding air.

6332. Thermal decomposition of calcium carbonate requires heat input and is endothermic.

6333. Thermal decomposition of copper carbonate needs heat and causes a temperature drop in the reacting zone if heat is not continuously supplied.

6334. Electrolysis of water requires energy input and behaves as an endothermic process.

6335. Photosynthesis absorbs energy from light and is an endothermic chemical process.

6336. Steam reforming of methane requires strong heat input and is endothermic.

6337. Dissolving ammonium nitrate in water absorbs heat, so the temperature of the mixture decreases.

6558. Melting ice absorbs heat and reduces the temperature of nearby materials.

6559. Sublimation of dry ice absorbs heat and cools the surrounding air.

6560. Thermal decomposition of calcium carbonate requires heat input and is endothermic.

6561. Thermal decomposition of copper carbonate needs heat and causes a temperature drop in the reacting zone if heat is not continuously supplied.

6562. Electrolysis of water requires energy input and behaves as an endothermic process.

6563. Photosynthesis absorbs energy from light and is an endothermic chemical process.

6564. Steam reforming of methane requires strong heat input and is endothermic.

6565. Dissolving ammonium nitrate in water absorbs heat, so the temperature of the mixture decreases.

6566. Dissolving potassium nitrate in water absorbs heat from the surroundings and causes cooling.

6567. Dissolving ammonium chloride in water is endothermic and makes the solution colder.

6568. Evaporation of water from a surface absorbs heat and lowers the surface temperature.

6569. Evaporation of ethanol absorbs heat from the surroundings and creates cooling.

6570. Melting ice absorbs heat and reduces the temperature of nearby materials.

6571. Sublimation of dry ice absorbs heat and cools the surrounding air.

6572. Thermal decomposition of calcium carbonate requires heat input and is endothermic.

6573. Thermal decomposition of copper carbonate needs heat and causes a temperature drop in the reacting zone if heat is not continuously supplied.

6574. Electrolysis of water requires energy input and behaves as an endothermic process.

6575. Photosynthesis absorbs energy from light and is an endothermic chemical process.

6576. Steam reforming of methane requires strong heat input and is endothermic.

6577. Dissolving ammonium nitrate in water absorbs heat, so the temperature of the mixture decreases.

6578. Dissolving potassium nitrate in water absorbs heat from the surroundings and causes cooling.

6579. Dissolving ammonium chloride in water is endothermic and makes the solution colder.

6580. Evaporation of water from a surface absorbs heat and lowers the surface temperature.

6581. Evaporation of ethanol absorbs heat from the surroundings and creates cooling.

6582. Melting ice absorbs heat and reduces the temperature of nearby materials.

6583. Sublimation of dry ice absorbs heat and cools the surrounding air.

6584. Thermal decomposition of calcium carbonate requires heat input and is endothermic.

6585. Thermal decomposition of copper carbonate needs heat and causes a temperature drop in the reacting zone if heat is not continuously supplied.

6586. Electrolysis of water requires energy input and behaves as an endothermic process.

6587. Photosynthesis absorbs energy from light and is an endothermic chemical process.

6588. Steam reforming of methane requires strong heat input and is endothermic.

6589. Dissolving ammonium nitrate in water absorbs heat, so the temperature of the mixture decreases.

6590. Dissolving potassium nitrate in water absorbs heat from the surroundings and causes cooling.

6591. Dissolving ammonium chloride in water is endothermic and makes the solution colder.

6592. Evaporation of water from a surface absorbs heat and lowers the surface temperature.

6593. Evaporation of ethanol absorbs heat from the surroundings and creates cooling.

6594. Melting ice absorbs heat and reduces the temperature of nearby materials.

6595. Sublimation of dry ice absorbs heat and cools the surrounding air.

6596. Thermal decomposition of calcium carbonate requires heat input and is endothermic.

6597. Thermal decomposition of copper carbonate needs heat and causes a temperature drop in the reacting zone if heat is not continuously supplied.

6598. Electrolysis of water requires energy input and behaves as an endothermic process.

6599. Photosynthesis absorbs energy from light and is an endothermic chemical process.

6600. Steam reforming of methane requires strong heat input and is endothermic.

6601. Dissolving ammonium nitrate in water absorbs heat, so the temperature of the mixture decreases.

6646. Electrolysis of water requires energy input and behaves as an endothermic process.

6647. Photosynthesis absorbs energy from light and is an endothermic chemical process.

6648. Steam reforming of methane requires strong heat input and is endothermic.

6649. Dissolving ammonium nitrate in water absorbs heat, so the temperature of the mixture decreases.

6650. Dissolving potassium nitrate in water absorbs heat from the surroundings and causes cooling.

6651. Dissolving ammonium chloride in water is endothermic and makes the solution colder.

6652. Evaporation of water from a surface absorbs heat and lowers the surface temperature.

6653. Evaporation of ethanol absorbs heat from the surroundings and creates cooling.

6654. Melting ice absorbs heat and reduces the temperature of nearby materials.

6655. Sublimation of dry ice absorbs heat and cools the surrounding air.

6656. Thermal decomposition of calcium carbonate requires heat input and is endothermic.

6657. Thermal decomposition of copper carbonate needs heat and causes a temperature drop in the reacting zone if heat is not continuously supplied.

6658. Electrolysis of water requires energy input and behaves as an endothermic process.

6659. Photosynthesis absorbs energy from light and is an endothermic chemical process.

6660. Steam reforming of methane requires strong heat input and is endothermic.

6661. Dissolving ammonium nitrate in water absorbs heat, so the temperature of the mixture decreases.

6662. Dissolving potassium nitrate in water absorbs heat from the surroundings and causes cooling.

6663. Dissolving ammonium chloride in water is endothermic and makes the solution colder.

6664. Evaporation of water from a surface absorbs heat and lowers the surface temperature.

6665. Evaporation of ethanol absorbs heat from the surroundings and creates cooling.

6666. Melting ice absorbs heat and reduces the temperature of nearby materials.

6667. Sublimation of dry ice absorbs heat and cools the surrounding air.

6668. Thermal decomposition of calcium carbonate requires heat input and is endothermic.

6669. Thermal decomposition of copper carbonate needs heat and causes a temperature drop in the reacting zone if heat is not continuously supplied.

6670. Electrolysis of water requires energy input and behaves as an endothermic process.

6671. Photosynthesis absorbs energy from light and is an endothermic chemical process.

6672. Steam reforming of methane requires strong heat input and is endothermic.

6673. Dissolving ammonium nitrate in water absorbs heat, so the temperature of the mixture decreases.

6674. Dissolving potassium nitrate in water absorbs heat from the surroundings and causes cooling.

6675. Dissolving ammonium chloride in water is endothermic and makes the solution colder.

6676. Evaporation of water from a surface absorbs heat and lowers the surface temperature.

6677. Evaporation of ethanol absorbs heat from the surroundings and creates cooling.

6678. Melting ice absorbs heat and reduces the temperature of nearby materials.

6679. Sublimation of dry ice absorbs heat and cools the surrounding air.

6680. Thermal decomposition of calcium carbonate requires heat input and is endothermic.

6681. Thermal decomposition of copper carbonate needs heat and causes a temperature drop in the reacting zone if heat is not continuously supplied.

6682. Electrolysis of water requires energy input and behaves as an endothermic process.

6683. Photosynthesis absorbs energy from light and is an endothermic chemical process.

6684. Steam reforming of methane requires strong heat input and is endothermic.

6685. Dissolving ammonium nitrate in water absorbs heat, so the temperature of the mixture decreases.

6686. Dissolving potassium nitrate in water absorbs heat from the surroundings and causes cooling.

6687. Dissolving ammonium chloride in water is endothermic and makes the solution colder.

6688. Evaporation of water from a surface absorbs heat and lowers the surface temperature.

6689. Evaporation of ethanol absorbs heat from the surroundings and creates cooling.

6734. Dissolving ammonium nitrate in water absorbs heat from the surroundings and causes cooling.

6735. Dissolving ammonium chloride in water is endothermic and makes the solution colder.

6736. Evaporation of water from a surface absorbs heat and lowers the surface temperature.

6737. Evaporation of ethanol absorbs heat from the surroundings and creates cooling.

6738. Melting ice absorbs heat and reduces the temperature of nearby materials.

6739. Sublimation of dry ice absorbs heat and cools the surrounding air.

6740. Thermal decomposition of calcium carbonate requires heat input and is endothermic.

6741. Thermal decomposition of copper carbonate needs heat and causes a temperature drop in the reacting zone if heat is not continuously supplied.

6742. Electrolysis of water requires energy input and behaves as an endothermic process.

6743. Photosynthesis absorbs energy from light and is an endothermic chemical process.

6744. Steam reforming of methane requires strong heat input and is endothermic.

6745. Dissolving ammonium nitrate in water absorbs heat, so the temperature of the mixture decreases.

6746. Dissolving potassium nitrate in water absorbs heat from the surroundings and causes cooling.

6747. Dissolving ammonium chloride in water is endothermic and makes the solution colder.

6748. Evaporation of water from a surface absorbs heat and lowers the surface temperature.

6749. Evaporation of ethanol absorbs heat from the surroundings and creates cooling.

6750. Melting ice absorbs heat and reduces the temperature of nearby materials.

6751. Sublimation of dry ice absorbs heat and cools the surrounding air.

6752. Thermal decomposition of calcium carbonate requires heat input and is endothermic.

6753. Thermal decomposition of copper carbonate needs heat and causes a temperature drop in the reacting zone if heat is not continuously supplied.

6754. Electrolysis of water requires energy input and behaves as an endothermic process.

6755. Photosynthesis absorbs energy from light and is an endothermic chemical process.

6756. Steam reforming of methane requires strong heat input and is endothermic.

6757. Dissolving ammonium nitrate in water absorbs heat, so the temperature of the mixture decreases.

6758. Dissolving potassium nitrate in water absorbs heat from the surroundings and causes cooling.

6759. Dissolving ammonium chloride in water is endothermic and makes the solution colder.

6760. Evaporation of water from a surface absorbs heat and lowers the surface temperature.

6761. Evaporation of ethanol absorbs heat from the surroundings and creates cooling.

6762. Melting ice absorbs heat and reduces the temperature of nearby materials.

6763. Sublimation of dry ice absorbs heat and cools the surrounding air.

6764. Thermal decomposition of calcium carbonate requires heat input and is endothermic.

6765. Thermal decomposition of copper carbonate needs heat and causes a temperature drop in the reacting zone if heat is not continuously supplied.

6766. Electrolysis of water requires energy input and behaves as an endothermic process.

6767. Photosynthesis absorbs energy from light and is an endothermic chemical process.

6768. Steam reforming of methane requires strong heat input and is endothermic.

6769. Dissolving ammonium nitrate in water absorbs heat, so the temperature of the mixture decreases.

6770. Dissolving potassium nitrate in water absorbs heat from the surroundings and causes cooling.

6771. Dissolving ammonium chloride in water is endothermic and makes the solution colder.

6772. Evaporation of water from a surface absorbs heat and lowers the surface temperature.

6773. Evaporation of ethanol absorbs heat from the surroundings and creates cooling.

6774. Melting ice absorbs heat and reduces the temperature of nearby materials.

6775. Sublimation of dry ice absorbs heat and cools the surrounding air.

6776. Thermal decomposition of calcium carbonate requires heat input and is endothermic.

6777. Thermal decomposition of copper carbonate needs heat and causes a temperature drop in the reacting zone if heat is not continuously supplied.

6822. Melting ice absorbs heat and reduces the temperature of nearby materials.

6823. Sublimation of dry ice absorbs heat and cools the surrounding air.

6824. Thermal decomposition of calcium carbonate requires heat input and is endothermic.

6825. Thermal decomposition of copper carbonate needs heat and causes a temperature drop in the reacting zone if heat is not continuously supplied.

6826. Electrolysis of water requires energy input and behaves as an endothermic process.

6827. Photosynthesis absorbs energy from light and is an endothermic chemical process.

6828. Steam reforming of methane requires strong heat input and is endothermic.

6829. Dissolving ammonium nitrate in water absorbs heat, so the temperature of the mixture decreases.

6830. Dissolving potassium nitrate in water absorbs heat from the surroundings and causes cooling.

6831. Dissolving ammonium chloride in water is endothermic and makes the solution colder.

6832. Evaporation of water from a surface absorbs heat and lowers the surface temperature.

6833. Evaporation of ethanol absorbs heat from the surroundings and creates cooling.

6834. Melting ice absorbs heat and reduces the temperature of nearby materials.

6835. Sublimation of dry ice absorbs heat and cools the surrounding air.

6836. Thermal decomposition of calcium carbonate requires heat input and is endothermic.

6837. Thermal decomposition of copper carbonate needs heat and causes a temperature drop in the reacting zone if heat is not continuously supplied.

6838. Electrolysis of water requires energy input and behaves as an endothermic process.

6839. Photosynthesis absorbs energy from light and is an endothermic chemical process.

6840. Steam reforming of methane requires strong heat input and is endothermic.

6841. Dissolving ammonium nitrate in water absorbs heat, so the temperature of the mixture decreases.

6842. Dissolving potassium nitrate in water absorbs heat from the surroundings and causes cooling.

6843. Dissolving ammonium chloride in water is endothermic and makes the solution colder.

6844. Evaporation of water from a surface absorbs heat and lowers the surface temperature.

6845. Evaporation of ethanol absorbs heat from the surroundings and creates cooling.

6846. Melting ice absorbs heat and reduces the temperature of nearby materials.

6847. Sublimation of dry ice absorbs heat and cools the surrounding air.

6848. Thermal decomposition of calcium carbonate requires heat input and is endothermic.

6849. Thermal decomposition of copper carbonate needs heat and causes a temperature drop in the reacting zone if heat is not continuously supplied.

6850. Electrolysis of water requires energy input and behaves as an endothermic process.

6851. Photosynthesis absorbs energy from light and is an endothermic chemical process.

6852. Steam reforming of methane requires strong heat input and is endothermic.

6853. Dissolving ammonium nitrate in water absorbs heat, so the temperature of the mixture decreases.

6854. Dissolving potassium nitrate in water absorbs heat from the surroundings and causes cooling.

6855. Dissolving ammonium chloride in water is endothermic and makes the solution colder.

6856. Evaporation of water from a surface absorbs heat and lowers the surface temperature.

6857. Evaporation of ethanol absorbs heat from the surroundings and creates cooling.

6858. Melting ice absorbs heat and reduces the temperature of nearby materials.

6859. Sublimation of dry ice absorbs heat and cools the surrounding air.

6860. Thermal decomposition of calcium carbonate requires heat input and is endothermic.

6861. Thermal decomposition of copper carbonate needs heat and causes a temperature drop in the reacting zone if heat is not continuously supplied.

6862. Electrolysis of water requires energy input and behaves as an endothermic process.

6863. Photosynthesis absorbs energy from light and is an endothermic chemical process.

6864. Steam reforming of methane requires strong heat input and is endothermic.

6865. Dissolving ammonium nitrate in water absorbs heat, so the temperature of the mixture decreases.

6910. Electrolysis of water requires energy input and behaves as an endothermic process.

6911. Photosynthesis absorbs energy from light and is an endothermic chemical process.

6912. Steam reforming of methane requires strong heat input and is endothermic.

6913. Dissolving ammonium nitrate in water absorbs heat, so the temperature of the mixture decreases.

6914. Dissolving potassium nitrate in water absorbs heat from the surroundings and causes cooling.

6915. Dissolving ammonium chloride in water is endothermic and makes the solution colder.

6916. Evaporation of water from a surface absorbs heat and lowers the surface temperature.

6917. Evaporation of ethanol absorbs heat from the surroundings and creates cooling.

6918. Melting ice absorbs heat and reduces the temperature of nearby materials.

6919. Sublimation of dry ice absorbs heat and cools the surrounding air.

6920. Thermal decomposition of calcium carbonate requires heat input and is endothermic.

6921. Thermal decomposition of copper carbonate needs heat and causes a temperature drop in the reacting zone if heat is not continuously supplied.

6922. Electrolysis of water requires energy input and behaves as an endothermic process.

6923. Photosynthesis absorbs energy from light and is an endothermic chemical process.

6924. Steam reforming of methane requires strong heat input and is endothermic.

6925. Dissolving ammonium nitrate in water absorbs heat, so the temperature of the mixture decreases.

6926. Dissolving potassium nitrate in water absorbs heat from the surroundings and causes cooling.

6927. Dissolving ammonium chloride in water is endothermic and makes the solution colder.

6928. Evaporation of water from a surface absorbs heat and lowers the surface temperature.

6929. Evaporation of ethanol absorbs heat from the surroundings and creates cooling.

6930. Melting ice absorbs heat and reduces the temperature of nearby materials.

6931. Sublimation of dry ice absorbs heat and cools the surrounding air.

6932. Thermal decomposition of calcium carbonate requires heat input and is endothermic.

6933. Thermal decomposition of copper carbonate needs heat and causes a temperature drop in the reacting zone if heat is not continuously supplied.

6934. Electrolysis of water requires energy input and behaves as an endothermic process.

6935. Photosynthesis absorbs energy from light and is an endothermic chemical process.

6936. Steam reforming of methane requires strong heat input and is endothermic.

6937. Dissolving ammonium nitrate in water absorbs heat, so the temperature of the mixture decreases.

6938. Dissolving potassium nitrate in water absorbs heat from the surroundings and causes cooling.

6939. Dissolving ammonium chloride in water is endothermic and makes the solution colder.

6940. Evaporation of water from a surface absorbs heat and lowers the surface temperature.

6941. Evaporation of ethanol absorbs heat from the surroundings and creates cooling.

6942. Melting ice absorbs heat and reduces the temperature of nearby materials.

6943. Sublimation of dry ice absorbs heat and cools the surrounding air.

6944. Thermal decomposition of calcium carbonate requires heat input and is endothermic.

6945. Thermal decomposition of copper carbonate needs heat and causes a temperature drop in the reacting zone if heat is not continuously supplied.

6946. Electrolysis of water requires energy input and behaves as an endothermic process.

6947. Photosynthesis absorbs energy from light and is an endothermic chemical process.

6948. Steam reforming of methane requires strong heat input and is endothermic.

6949. Dissolving ammonium nitrate in water absorbs heat, so the temperature of the mixture decreases.

6950. Dissolving potassium nitrate in water absorbs heat from the surroundings and causes cooling.

6951. Dissolving ammonium chloride in water is endothermic and makes the solution colder.

6952. Evaporation of water from a surface absorbs heat and lowers the surface temperature.

6953. Evaporation of ethanol absorbs heat from the surroundings and creates cooling.

6998. Dissolving potassium nitrate in water absorbs heat from the surroundings and causes cooling.
6999. Dissolving ammonium chloride in water is endothermic and makes the solution colder.
7000. Evaporation of water from a surface absorbs heat and lowers the surface temperature.
7001. Evaporation of ethanol absorbs heat from the surroundings and creates cooling.
7002. Melting ice absorbs heat and reduces the temperature of nearby materials.
7003. Sublimation of dry ice absorbs heat and cools the surrounding air.
7004. Thermal decomposition of calcium carbonate requires heat input and is endothermic.
7005. Thermal decomposition of copper carbonate needs heat and causes a temperature drop in the reacting zone if heat is not continuously supplied.
7006. Electrolysis of water requires energy input and behaves as an endothermic process.
7007. Photosynthesis absorbs energy from light and is an endothermic chemical process.
7008. Steam reforming of methane requires strong heat input and is endothermic.
7009. Dissolving ammonium nitrate in water absorbs heat, so the temperature of the mixture decreases.
7010. Dissolving potassium nitrate in water absorbs heat from the surroundings and causes cooling.
7011. Dissolving ammonium chloride in water is endothermic and makes the solution colder.
7012. Evaporation of water from a surface absorbs heat and lowers the surface temperature.
7013. Evaporation of ethanol absorbs heat from the surroundings and creates cooling.
7014. Melting ice absorbs heat and reduces the temperature of nearby materials.
7015. Sublimation of dry ice absorbs heat and cools the surrounding air.
7016. Thermal decomposition of calcium carbonate requires heat input and is endothermic.
7017. Thermal decomposition of copper carbonate needs heat and causes a temperature drop in the reacting zone if heat is not continuously supplied.
7018. Electrolysis of water requires energy input and behaves as an endothermic process.
7019. Photosynthesis absorbs energy from light and is an endothermic chemical process.
7020. Steam reforming of methane requires strong heat input and is endothermic.
7021. Dissolving ammonium nitrate in water absorbs heat, so the temperature of the mixture decreases.
7022. Dissolving potassium nitrate in water absorbs heat from the surroundings and causes cooling.
7023. Dissolving ammonium chloride in water is endothermic and makes the solution colder.
7024. Evaporation of water from a surface absorbs heat and lowers the surface temperature.
7025. Evaporation of ethanol absorbs heat from the surroundings and creates cooling.
7026. Melting ice absorbs heat and reduces the temperature of nearby materials.
7027. Sublimation of dry ice absorbs heat and cools the surrounding air.
7028. Thermal decomposition of calcium carbonate requires heat input and is endothermic.
7029. Thermal decomposition of copper carbonate needs heat and causes a temperature drop in the reacting zone if heat is not continuously supplied.
7030. Electrolysis of water requires energy input and behaves as an endothermic process.
7031. Photosynthesis absorbs energy from light and is an endothermic chemical process.
7032. Steam reforming of methane requires strong heat input and is endothermic.
7033. Dissolving ammonium nitrate in water absorbs heat, so the temperature of the mixture decreases.
7034. Dissolving potassium nitrate in water absorbs heat from the surroundings and causes cooling.
7035. Dissolving ammonium chloride in water is endothermic and makes the solution colder.
7036. Evaporation of water from a surface absorbs heat and lowers the surface temperature.
7037. Evaporation of ethanol absorbs heat from the surroundings and creates cooling.
7038. Melting ice absorbs heat and reduces the temperature of nearby materials.
7039. Sublimation of dry ice absorbs heat and cools the surrounding air.
7040. Thermal decomposition of calcium carbonate requires heat input and is endothermic.
7041. Thermal decomposition of copper carbonate needs heat and causes a temperature drop in the reacting zone if heat is not continuously supplied.

7086. Melting ice absorbs heat and reduces the temperature of nearby materials.

7087. Sublimation of dry ice absorbs heat and cools the surrounding air.

7088. Thermal decomposition of calcium carbonate requires heat input and is endothermic.

7089. Thermal decomposition of copper carbonate needs heat and causes a temperature drop in the reacting zone if heat is not continuously supplied.

7090. Electrolysis of water requires energy input and behaves as an endothermic process.

7091. Photosynthesis absorbs energy from light and is an endothermic chemical process.

7092. Steam reforming of methane requires strong heat input and is endothermic.

7093. Dissolving ammonium nitrate in water absorbs heat, so the temperature of the mixture decreases.

7094. Dissolving potassium nitrate in water absorbs heat from the surroundings and causes cooling.

7095. Dissolving ammonium chloride in water is endothermic and makes the solution colder.

7096. Evaporation of water from a surface absorbs heat and lowers the surface temperature.

7097. Evaporation of ethanol absorbs heat from the surroundings and creates cooling.

7098. Melting ice absorbs heat and reduces the temperature of nearby materials.

7099. Sublimation of dry ice absorbs heat and cools the surrounding air.

7100. Thermal decomposition of calcium carbonate requires heat input and is endothermic.

7101. Thermal decomposition of copper carbonate needs heat and causes a temperature drop in the reacting zone if heat is not continuously supplied.

7102. Electrolysis of water requires energy input and behaves as an endothermic process.

7103. Photosynthesis absorbs energy from light and is an endothermic chemical process.

7104. Steam reforming of methane requires strong heat input and is endothermic.

7105. Dissolving ammonium nitrate in water absorbs heat, so the temperature of the mixture decreases.

7106. Dissolving potassium nitrate in water absorbs heat from the surroundings and causes cooling.

7107. Dissolving ammonium chloride in water is endothermic and makes the solution colder.

7108. Evaporation of water from a surface absorbs heat and lowers the surface temperature.

7109. Evaporation of ethanol absorbs heat from the surroundings and creates cooling.

7110. Melting ice absorbs heat and reduces the temperature of nearby materials.

7111. Sublimation of dry ice absorbs heat and cools the surrounding air.

7112. Thermal decomposition of calcium carbonate requires heat input and is endothermic.

7113. Thermal decomposition of copper carbonate needs heat and causes a temperature drop in the reacting zone if heat is not continuously supplied.

7114. Electrolysis of water requires energy input and behaves as an endothermic process.

7115. Photosynthesis absorbs energy from light and is an endothermic chemical process.

7116. Steam reforming of methane requires strong heat input and is endothermic.

7117. Dissolving ammonium nitrate in water absorbs heat, so the temperature of the mixture decreases.

7118. Dissolving potassium nitrate in water absorbs heat from the surroundings and causes cooling.

7119. Dissolving ammonium chloride in water is endothermic and makes the solution colder.

7120. Evaporation of water from a surface absorbs heat and lowers the surface temperature.

7121. Evaporation of ethanol absorbs heat from the surroundings and creates cooling.

7122. Melting ice absorbs heat and reduces the temperature of nearby materials.

7123. Sublimation of dry ice absorbs heat and cools the surrounding air.

7124. Thermal decomposition of calcium carbonate requires heat input and is endothermic.

7125. Thermal decomposition of copper carbonate needs heat and causes a temperature drop in the reacting zone if heat is not continuously supplied.

7126. Electrolysis of water requires energy input and behaves as an endothermic process.

7127. Photosynthesis absorbs energy from light and is an endothermic chemical process.

7128. Steam reforming of methane requires strong heat input and is endothermic.

7129. Dissolving ammonium nitrate in water absorbs heat, so the temperature of the mixture decreases.

1999: Thermal decomposition of copper carbonate needs heat and causes temperature drop in the reacting zone if heat is not continuously supplied.

7350. Melting ice absorbs heat and reduces the temperature of nearby materials.

7351. Sublimation of dry ice absorbs heat and cools the surrounding air.

7352. Thermal decomposition of calcium carbonate requires heat input and is endothermic.

7353. Thermal decomposition of copper carbonate needs heat and causes a temperature drop in the reacting zone if heat is not continuously supplied.

7354. Electrolysis of water requires energy input and behaves as an endothermic process.

7355. Photosynthesis absorbs energy from light and is an endothermic chemical process.

7356. Steam reforming of methane requires strong heat input and is endothermic.

7357. Dissolving ammonium nitrate in water absorbs heat, so the temperature of the mixture decreases.

7358. Dissolving potassium nitrate in water absorbs heat from the surroundings and causes cooling.

7359. Dissolving ammonium chloride in water is endothermic and makes the solution colder.

7360. Evaporation of water from a surface absorbs heat and lowers the surface temperature.

7361. Evaporation of ethanol absorbs heat from the surroundings and creates cooling.

7362. Melting ice absorbs heat and reduces the temperature of nearby materials.

7363. Sublimation of dry ice absorbs heat and cools the surrounding air.

7364. Thermal decomposition of calcium carbonate requires heat input and is endothermic.

7365. Thermal decomposition of copper carbonate needs heat and causes a temperature drop in the reacting zone if heat is not continuously supplied.

7366. Electrolysis of water requires energy input and behaves as an endothermic process.

7367. Photosynthesis absorbs energy from light and is an endothermic chemical process.

7368. Steam reforming of methane requires strong heat input and is endothermic.

7369. Dissolving ammonium nitrate in water absorbs heat, so the temperature of the mixture decreases.

7370. Dissolving potassium nitrate in water absorbs heat from the surroundings and causes cooling.

7371. Dissolving ammonium chloride in water is endothermic and makes the solution colder.

7372. Evaporation of water from a surface absorbs heat and lowers the surface temperature.

7373. Evaporation of ethanol absorbs heat from the surroundings and creates cooling.

7374. Melting ice absorbs heat and reduces the temperature of nearby materials.

7375. Sublimation of dry ice absorbs heat and cools the surrounding air.

7376. Thermal decomposition of calcium carbonate requires heat input and is endothermic.

7377. Thermal decomposition of copper carbonate needs heat and causes a temperature drop in the reacting zone if heat is not continuously supplied.

7378. Electrolysis of water requires energy input and behaves as an endothermic process.

7379. Photosynthesis absorbs energy from light and is an endothermic chemical process.

7380. Steam reforming of methane requires strong heat input and is endothermic.

7381. Dissolving ammonium nitrate in water absorbs heat, so the temperature of the mixture decreases.

7382. Dissolving potassium nitrate in water absorbs heat from the surroundings and causes cooling.

7383. Dissolving ammonium chloride in water is endothermic and makes the solution colder.

7384. Evaporation of water from a surface absorbs heat and lowers the surface temperature.

7385. Evaporation of ethanol absorbs heat from the surroundings and creates cooling.

7386. Melting ice absorbs heat and reduces the temperature of nearby materials.

7387. Sublimation of dry ice absorbs heat and cools the surrounding air.

7388. Thermal decomposition of calcium carbonate requires heat input and is endothermic.

7389. Thermal decomposition of copper carbonate needs heat and causes a temperature drop in the reacting zone if heat is not continuously supplied.

7390. Electrolysis of water requires energy input and behaves as an endothermic process.

7391. Photosynthesis absorbs energy from light and is an endothermic chemical process.

7392. Steam reforming of methane requires strong heat input and is endothermic.

7393. Dissolving ammonium nitrate in water absorbs heat, so the temperature of the mixture decreases.

1999: Thermal decomposition of copper carbonate needs heat and causes a temperature drop in the reacting zone if heat is not continuously supplied.

7614. Melting ice absorbs heat and reduces the temperature of nearby materials.

7615. Sublimation of dry ice absorbs heat and cools the surrounding air.

7616. Thermal decomposition of calcium carbonate requires heat input and is endothermic.

7617. Thermal decomposition of copper carbonate needs heat and causes a temperature drop in the reacting zone if heat is not continuously supplied.

7618. Electrolysis of water requires energy input and behaves as an endothermic process.

7619. Photosynthesis absorbs energy from light and is an endothermic chemical process.

7620. Steam reforming of methane requires strong heat input and is endothermic.

7621. Dissolving ammonium nitrate in water absorbs heat, so the temperature of the mixture decreases.

7622. Dissolving potassium nitrate in water absorbs heat from the surroundings and causes cooling.

7623. Dissolving ammonium chloride in water is endothermic and makes the solution colder.

7624. Evaporation of water from a surface absorbs heat and lowers the surface temperature.

7625. Evaporation of ethanol absorbs heat from the surroundings and creates cooling.

7626. Melting ice absorbs heat and reduces the temperature of nearby materials.

7627. Sublimation of dry ice absorbs heat and cools the surrounding air.

7628. Thermal decomposition of calcium carbonate requires heat input and is endothermic.

7629. Thermal decomposition of copper carbonate needs heat and causes a temperature drop in the reacting zone if heat is not continuously supplied.

7630. Electrolysis of water requires energy input and behaves as an endothermic process.

7631. Photosynthesis absorbs energy from light and is an endothermic chemical process.

7632. Steam reforming of methane requires strong heat input and is endothermic.

7633. Dissolving ammonium nitrate in water absorbs heat, so the temperature of the mixture decreases.

7634. Dissolving potassium nitrate in water absorbs heat from the surroundings and causes cooling.

7635. Dissolving ammonium chloride in water is endothermic and makes the solution colder.

7636. Evaporation of water from a surface absorbs heat and lowers the surface temperature.

7637. Evaporation of ethanol absorbs heat from the surroundings and creates cooling.

7638. Melting ice absorbs heat and reduces the temperature of nearby materials.

7639. Sublimation of dry ice absorbs heat and cools the surrounding air.

7640. Thermal decomposition of calcium carbonate requires heat input and is endothermic.

7641. Thermal decomposition of copper carbonate needs heat and causes a temperature drop in the reacting zone if heat is not continuously supplied.

7642. Electrolysis of water requires energy input and behaves as an endothermic process.

7643. Photosynthesis absorbs energy from light and is an endothermic chemical process.

7644. Steam reforming of methane requires strong heat input and is endothermic.

7645. Dissolving ammonium nitrate in water absorbs heat, so the temperature of the mixture decreases.

7646. Dissolving potassium nitrate in water absorbs heat from the surroundings and causes cooling.

7647. Dissolving ammonium chloride in water is endothermic and makes the solution colder.

7648. Evaporation of water from a surface absorbs heat and lowers the surface temperature.

7649. Evaporation of ethanol absorbs heat from the surroundings and creates cooling.

7650. Melting ice absorbs heat and reduces the temperature of nearby materials.

7651. Sublimation of dry ice absorbs heat and cools the surrounding air.

7652. Thermal decomposition of calcium carbonate requires heat input and is endothermic.

7653. Thermal decomposition of copper carbonate needs heat and causes a temperature drop in the reacting zone if heat is not continuously supplied.

7654. Electrolysis of water requires energy input and behaves as an endothermic process.

7655. Photosynthesis absorbs energy from light and is an endothermic chemical process.

7656. Steam reforming of methane requires strong heat input and is endothermic.

7657. Dissolving ammonium nitrate in water absorbs heat, so the temperature of the mixture decreases.

7833. Thermal decomposition of copper carbonate needs heat and causes a temperature drop in the reacting zone if heat is not continuously supplied.

7878. Melting ice absorbs heat and reduces the temperature of nearby materials.

7879. Sublimation of dry ice absorbs heat and cools the surrounding air.

7880. Thermal decomposition of calcium carbonate requires heat input and is endothermic.

7881. Thermal decomposition of copper carbonate needs heat and causes a temperature drop in the reacting zone if heat is not continuously supplied.

7882. Electrolysis of water requires energy input and behaves as an endothermic process.

7883. Photosynthesis absorbs energy from light and is an endothermic chemical process.

7884. Steam reforming of methane requires strong heat input and is endothermic.

7885. Dissolving ammonium nitrate in water absorbs heat, so the temperature of the mixture decreases.

7886. Dissolving potassium nitrate in water absorbs heat from the surroundings and causes cooling.

7887. Dissolving ammonium chloride in water is endothermic and makes the solution colder.

7888. Evaporation of water from a surface absorbs heat and lowers the surface temperature.

7889. Evaporation of ethanol absorbs heat from the surroundings and creates cooling.

7890. Melting ice absorbs heat and reduces the temperature of nearby materials.

7891. Sublimation of dry ice absorbs heat and cools the surrounding air.

7892. Thermal decomposition of calcium carbonate requires heat input and is endothermic.

7893. Thermal decomposition of copper carbonate needs heat and causes a temperature drop in the reacting zone if heat is not continuously supplied.

7894. Electrolysis of water requires energy input and behaves as an endothermic process.

7895. Photosynthesis absorbs energy from light and is an endothermic chemical process.

7896. Steam reforming of methane requires strong heat input and is endothermic.

7897. Dissolving ammonium nitrate in water absorbs heat, so the temperature of the mixture decreases.

7898. Dissolving potassium nitrate in water absorbs heat from the surroundings and causes cooling.

7899. Dissolving ammonium chloride in water is endothermic and makes the solution colder.

7900. Evaporation of water from a surface absorbs heat and lowers the surface temperature.

7901. Evaporation of ethanol absorbs heat from the surroundings and creates cooling.

7902. Melting ice absorbs heat and reduces the temperature of nearby materials.

7903. Sublimation of dry ice absorbs heat and cools the surrounding air.

7904. Thermal decomposition of calcium carbonate requires heat input and is endothermic.

7905. Thermal decomposition of copper carbonate needs heat and causes a temperature drop in the reacting zone if heat is not continuously supplied.

7906. Electrolysis of water requires energy input and behaves as an endothermic process.

7907. Photosynthesis absorbs energy from light and is an endothermic chemical process.

7908. Steam reforming of methane requires strong heat input and is endothermic.

7909. Dissolving ammonium nitrate in water absorbs heat, so the temperature of the mixture decreases.

7910. Dissolving potassium nitrate in water absorbs heat from the surroundings and causes cooling.

7911. Dissolving ammonium chloride in water is endothermic and makes the solution colder.

7912. Evaporation of water from a surface absorbs heat and lowers the surface temperature.

7913. Evaporation of ethanol absorbs heat from the surroundings and creates cooling.

7914. Melting ice absorbs heat and reduces the temperature of nearby materials.

7915. Sublimation of dry ice absorbs heat and cools the surrounding air.

7916. Thermal decomposition of calcium carbonate requires heat input and is endothermic.

7917. Thermal decomposition of copper carbonate needs heat and causes a temperature drop in the reacting zone if heat is not continuously supplied.

7918. Electrolysis of water requires energy input and behaves as an endothermic process.

7919. Photosynthesis absorbs energy from light and is an endothermic chemical process.

7920. Steam reforming of methane requires strong heat input and is endothermic.

7921. Dissolving ammonium nitrate in water absorbs heat, so the temperature of the mixture decreases.

8142. Melting ice absorbs heat and reduces the temperature of nearby materials.

8143. Sublimation of dry ice absorbs heat and cools the surrounding air.

8144. Thermal decomposition of calcium carbonate requires heat input and is endothermic.

8145. Thermal decomposition of copper carbonate needs heat and causes a temperature drop in the reacting zone if heat is not continuously supplied.

8146. Electrolysis of water requires energy input and behaves as an endothermic process.

8147. Photosynthesis absorbs energy from light and is an endothermic chemical process.

8148. Steam reforming of methane requires strong heat input and is endothermic.

8149. Dissolving ammonium nitrate in water absorbs heat, so the temperature of the mixture decreases.

8150. Dissolving potassium nitrate in water absorbs heat from the surroundings and causes cooling.

8151. Dissolving ammonium chloride in water is endothermic and makes the solution colder.

8152. Evaporation of water from a surface absorbs heat and lowers the surface temperature.

8153. Evaporation of ethanol absorbs heat from the surroundings and creates cooling.

8154. Melting ice absorbs heat and reduces the temperature of nearby materials.

8155. Sublimation of dry ice absorbs heat and cools the surrounding air.

8156. Thermal decomposition of calcium carbonate requires heat input and is endothermic.

8157. Thermal decomposition of copper carbonate needs heat and causes a temperature drop in the reacting zone if heat is not continuously supplied.

8158. Electrolysis of water requires energy input and behaves as an endothermic process.

8159. Photosynthesis absorbs energy from light and is an endothermic chemical process.

8160. Steam reforming of methane requires strong heat input and is endothermic.

8161. Dissolving ammonium nitrate in water absorbs heat, so the temperature of the mixture decreases.

8162. Dissolving potassium nitrate in water absorbs heat from the surroundings and causes cooling.

8163. Dissolving ammonium chloride in water is endothermic and makes the solution colder.

8164. Evaporation of water from a surface absorbs heat and lowers the surface temperature.

8165. Evaporation of ethanol absorbs heat from the surroundings and creates cooling.

8166. Melting ice absorbs heat and reduces the temperature of nearby materials.

8167. Sublimation of dry ice absorbs heat and cools the surrounding air.

8168. Thermal decomposition of calcium carbonate requires heat input and is endothermic.

8169. Thermal decomposition of copper carbonate needs heat and causes a temperature drop in the reacting zone if heat is not continuously supplied.

8170. Electrolysis of water requires energy input and behaves as an endothermic process.

8171. Photosynthesis absorbs energy from light and is an endothermic chemical process.

8172. Steam reforming of methane requires strong heat input and is endothermic.

8173. Dissolving ammonium nitrate in water absorbs heat, so the temperature of the mixture decreases.

8174. Dissolving potassium nitrate in water absorbs heat from the surroundings and causes cooling.

8175. Dissolving ammonium chloride in water is endothermic and makes the solution colder.

8176. Evaporation of water from a surface absorbs heat and lowers the surface temperature.

8177. Evaporation of ethanol absorbs heat from the surroundings and creates cooling.

8178. Melting ice absorbs heat and reduces the temperature of nearby materials.

8179. Sublimation of dry ice absorbs heat and cools the surrounding air.

8180. Thermal decomposition of calcium carbonate requires heat input and is endothermic.

8181. Thermal decomposition of copper carbonate needs heat and causes a temperature drop in the reacting zone if heat is not continuously supplied.

8182. Electrolysis of water requires energy input and behaves as an endothermic process.

8183. Photosynthesis absorbs energy from light and is an endothermic chemical process.

8184. Steam reforming of methane requires strong heat input and is endothermic.

8185. Dissolving ammonium nitrate in water absorbs heat, so the temperature of the mixture decreases.

8318. Dissolving potassium nitrate in water absorbs heat from the surroundings and causes cooling.

8319. Dissolving ammonium chloride in water is endothermic and makes the solution colder.

8320. Evaporation of water from a surface absorbs heat and lowers the surface temperature.

8321. Evaporation of ethanol absorbs heat from the surroundings and creates cooling.

8322. Melting ice absorbs heat and reduces the temperature of nearby materials.

8323. Sublimation of dry ice absorbs heat and cools the surrounding air.

8324. Thermal decomposition of calcium carbonate requires heat input and is endothermic.

8325. Thermal decomposition of copper carbonate needs heat and causes a temperature drop in the reacting zone if heat is not continuously supplied.

8326. Electrolysis of water requires energy input and behaves as an endothermic process.

8327. Photosynthesis absorbs energy from light and is an endothermic chemical process.

8328. Steam reforming of methane requires strong heat input and is endothermic.

8329. Dissolving ammonium nitrate in water absorbs heat, so the temperature of the mixture decreases.

8330. Dissolving potassium nitrate in water absorbs heat from the surroundings and causes cooling.

8331. Dissolving ammonium chloride in water is endothermic and makes the solution colder.

8332. Evaporation of water from a surface absorbs heat and lowers the surface temperature.

8333. Evaporation of ethanol absorbs heat from the surroundings and creates cooling.

8334. Melting ice absorbs heat and reduces the temperature of nearby materials.

8335. Sublimation of dry ice absorbs heat and cools the surrounding air.

8336. Thermal decomposition of calcium carbonate requires heat input and is endothermic.

8337. Thermal decomposition of copper carbonate needs heat and causes a temperature drop in the reacting zone if heat is not continuously supplied.

8338. Electrolysis of water requires energy input and behaves as an endothermic process.

8339. Photosynthesis absorbs energy from light and is an endothermic chemical process.

8340. Steam reforming of methane requires strong heat input and is endothermic.

8341. Dissolving ammonium nitrate in water absorbs heat, so the temperature of the mixture decreases.

8342. Dissolving potassium nitrate in water absorbs heat from the surroundings and causes cooling.

8343. Dissolving ammonium chloride in water is endothermic and makes the solution colder.

8344. Evaporation of water from a surface absorbs heat and lowers the surface temperature.

8345. Evaporation of ethanol absorbs heat from the surroundings and creates cooling.

8346. Melting ice absorbs heat and reduces the temperature of nearby materials.

8347. Sublimation of dry ice absorbs heat and cools the surrounding air.

8348. Thermal decomposition of calcium carbonate requires heat input and is endothermic.

8349. Thermal decomposition of copper carbonate needs heat and causes a temperature drop in the reacting zone if heat is not continuously supplied.

8350. Electrolysis of water requires energy input and behaves as an endothermic process.

8351. Photosynthesis absorbs energy from light and is an endothermic chemical process.

8352. Steam reforming of methane requires strong heat input and is endothermic.

8353. Dissolving ammonium nitrate in water absorbs heat, so the temperature of the mixture decreases.

8354. Dissolving potassium nitrate in water absorbs heat from the surroundings and causes cooling.

8355. Dissolving ammonium chloride in water is endothermic and makes the solution colder.

8356. Evaporation of water from a surface absorbs heat and lowers the surface temperature.

8357. Evaporation of ethanol absorbs heat from the surroundings and creates cooling.

8358. Melting ice absorbs heat and reduces the temperature of nearby materials.

8359. Sublimation of dry ice absorbs heat and cools the surrounding air.

8360. Thermal decomposition of calcium carbonate requires heat input and is endothermic.

8361. Thermal decomposition of copper carbonate needs heat and causes a temperature drop in the reacting zone if heat is not continuously supplied.

8406. Melting ice absorbs heat and reduces the temperature of nearby materials.

8407. Sublimation of dry ice absorbs heat and cools the surrounding air.

8408. Thermal decomposition of calcium carbonate requires heat input and is endothermic.

8409. Thermal decomposition of copper carbonate needs heat and causes a temperature drop in the reacting zone if heat is not continuously supplied.

8410. Electrolysis of water requires energy input and behaves as an endothermic process.

8411. Photosynthesis absorbs energy from light and is an endothermic chemical process.

8412. Steam reforming of methane requires strong heat input and is endothermic.

8413. Dissolving ammonium nitrate in water absorbs heat, so the temperature of the mixture decreases.

8414. Dissolving potassium nitrate in water absorbs heat from the surroundings and causes cooling.

8415. Dissolving ammonium chloride in water is endothermic and makes the solution colder.

8416. Evaporation of water from a surface absorbs heat and lowers the surface temperature.

8417. Evaporation of ethanol absorbs heat from the surroundings and creates cooling.

8418. Melting ice absorbs heat and reduces the temperature of nearby materials.

8419. Sublimation of dry ice absorbs heat and cools the surrounding air.

8420. Thermal decomposition of calcium carbonate requires heat input and is endothermic.

8421. Thermal decomposition of copper carbonate needs heat and causes a temperature drop in the reacting zone if heat is not continuously supplied.

8422. Electrolysis of water requires energy input and behaves as an endothermic process.

8423. Photosynthesis absorbs energy from light and is an endothermic chemical process.

8424. Steam reforming of methane requires strong heat input and is endothermic.

8425. Dissolving ammonium nitrate in water absorbs heat, so the temperature of the mixture decreases.

8426. Dissolving potassium nitrate in water absorbs heat from the surroundings and causes cooling.

8427. Dissolving ammonium chloride in water is endothermic and makes the solution colder.

8428. Evaporation of water from a surface absorbs heat and lowers the surface temperature.

8429. Evaporation of ethanol absorbs heat from the surroundings and creates cooling.

8430. Melting ice absorbs heat and reduces the temperature of nearby materials.

8431. Sublimation of dry ice absorbs heat and cools the surrounding air.

8432. Thermal decomposition of calcium carbonate requires heat input and is endothermic.

8433. Thermal decomposition of copper carbonate needs heat and causes a temperature drop in the reacting zone if heat is not continuously supplied.

8434. Electrolysis of water requires energy input and behaves as an endothermic process.

8435. Photosynthesis absorbs energy from light and is an endothermic chemical process.

8436. Steam reforming of methane requires strong heat input and is endothermic.

8437. Dissolving ammonium nitrate in water absorbs heat, so the temperature of the mixture decreases.

8438. Dissolving potassium nitrate in water absorbs heat from the surroundings and causes cooling.

8439. Dissolving ammonium chloride in water is endothermic and makes the solution colder.

8440. Evaporation of water from a surface absorbs heat and lowers the surface temperature.

8441. Evaporation of ethanol absorbs heat from the surroundings and creates cooling.

8442. Melting ice absorbs heat and reduces the temperature of nearby materials.

8443. Sublimation of dry ice absorbs heat and cools the surrounding air.

8444. Thermal decomposition of calcium carbonate requires heat input and is endothermic.

8445. Thermal decomposition of copper carbonate needs heat and causes a temperature drop in the reacting zone if heat is not continuously supplied.

8446. Electrolysis of water requires energy input and behaves as an endothermic process.

8447. Photosynthesis absorbs energy from light and is an endothermic chemical process.

8448. Steam reforming of methane requires strong heat input and is endothermic.

8449. Dissolving ammonium nitrate in water absorbs heat, so the temperature of the mixture decreases.

8582. Dissolving potassium nitrate in water absorbs heat from the surroundings and causes cooling.

8583. Dissolving ammonium chloride in water is endothermic and makes the solution colder.

8584. Evaporation of water from a surface absorbs heat and lowers the surface temperature.

8585. Evaporation of ethanol absorbs heat from the surroundings and creates cooling.

8586. Melting ice absorbs heat and reduces the temperature of nearby materials.

8587. Sublimation of dry ice absorbs heat and cools the surrounding air.

8588. Thermal decomposition of calcium carbonate requires heat input and is endothermic.

8589. Thermal decomposition of copper carbonate needs heat and causes a temperature drop in the reacting zone if heat is not continuously supplied.

8590. Electrolysis of water requires energy input and behaves as an endothermic process.

8591. Photosynthesis absorbs energy from light and is an endothermic chemical process.

8592. Steam reforming of methane requires strong heat input and is endothermic.

8593. Dissolving ammonium nitrate in water absorbs heat, so the temperature of the mixture decreases.

8594. Dissolving potassium nitrate in water absorbs heat from the surroundings and causes cooling.

8595. Dissolving ammonium chloride in water is endothermic and makes the solution colder.

8596. Evaporation of water from a surface absorbs heat and lowers the surface temperature.

8597. Evaporation of ethanol absorbs heat from the surroundings and creates cooling.

8598. Melting ice absorbs heat and reduces the temperature of nearby materials.

8599. Sublimation of dry ice absorbs heat and cools the surrounding air.

8600. Thermal decomposition of calcium carbonate requires heat input and is endothermic.

8601. Thermal decomposition of copper carbonate needs heat and causes a temperature drop in the reacting zone if heat is not continuously supplied.

8602. Electrolysis of water requires energy input and behaves as an endothermic process.

8603. Photosynthesis absorbs energy from light and is an endothermic chemical process.

8604. Steam reforming of methane requires strong heat input and is endothermic.

8605. Dissolving ammonium nitrate in water absorbs heat, so the temperature of the mixture decreases.

8606. Dissolving potassium nitrate in water absorbs heat from the surroundings and causes cooling.

8607. Dissolving ammonium chloride in water is endothermic and makes the solution colder.

8608. Evaporation of water from a surface absorbs heat and lowers the surface temperature.

8609. Evaporation of ethanol absorbs heat from the surroundings and creates cooling.

8610. Melting ice absorbs heat and reduces the temperature of nearby materials.

8611. Sublimation of dry ice absorbs heat and cools the surrounding air.

8612. Thermal decomposition of calcium carbonate requires heat input and is endothermic.

8613. Thermal decomposition of copper carbonate needs heat and causes a temperature drop in the reacting zone if heat is not continuously supplied.

8614. Electrolysis of water requires energy input and behaves as an endothermic process.

8615. Photosynthesis absorbs energy from light and is an endothermic chemical process.

8616. Steam reforming of methane requires strong heat input and is endothermic.

8617. Dissolving ammonium nitrate in water absorbs heat, so the temperature of the mixture decreases.

8618. Dissolving potassium nitrate in water absorbs heat from the surroundings and causes cooling.

8619. Dissolving ammonium chloride in water is endothermic and makes the solution colder.

8620. Evaporation of water from a surface absorbs heat and lowers the surface temperature.

8621. Evaporation of ethanol absorbs heat from the surroundings and creates cooling.

8622. Melting ice absorbs heat and reduces the temperature of nearby materials.

8623. Sublimation of dry ice absorbs heat and cools the surrounding air.

8624. Thermal decomposition of calcium carbonate requires heat input and is endothermic.

8625. Thermal decomposition of copper carbonate needs heat and causes a temperature drop in the reacting zone if heat is not continuously supplied.

8670. Melting ice absorbs heat and reduces the temperature of nearby materials.

8671. Sublimation of dry ice absorbs heat and cools the surrounding air.

8672. Thermal decomposition of calcium carbonate requires heat input and is endothermic.

8673. Thermal decomposition of copper carbonate needs heat and causes a temperature drop in the reacting zone if heat is not continuously supplied.

8674. Electrolysis of water requires energy input and behaves as an endothermic process.

8675. Photosynthesis absorbs energy from light and is an endothermic chemical process.

8676. Steam reforming of methane requires strong heat input and is endothermic.

8677. Dissolving ammonium nitrate in water absorbs heat, so the temperature of the mixture decreases.

8678. Dissolving potassium nitrate in water absorbs heat from the surroundings and causes cooling.

8679. Dissolving ammonium chloride in water is endothermic and makes the solution colder.

8680. Evaporation of water from a surface absorbs heat and lowers the surface temperature.

8681. Evaporation of ethanol absorbs heat from the surroundings and creates cooling.

8682. Melting ice absorbs heat and reduces the temperature of nearby materials.

8683. Sublimation of dry ice absorbs heat and cools the surrounding air.

8684. Thermal decomposition of calcium carbonate requires heat input and is endothermic.

8685. Thermal decomposition of copper carbonate needs heat and causes a temperature drop in the reacting zone if heat is not continuously supplied.

8686. Electrolysis of water requires energy input and behaves as an endothermic process.

8687. Photosynthesis absorbs energy from light and is an endothermic chemical process.

8688. Steam reforming of methane requires strong heat input and is endothermic.

8689. Dissolving ammonium nitrate in water absorbs heat, so the temperature of the mixture decreases.

8690. Dissolving potassium nitrate in water absorbs heat from the surroundings and causes cooling.

8691. Dissolving ammonium chloride in water is endothermic and makes the solution colder.

8692. Evaporation of water from a surface absorbs heat and lowers the surface temperature.

8693. Evaporation of ethanol absorbs heat from the surroundings and creates cooling.

8694. Melting ice absorbs heat and reduces the temperature of nearby materials.

8695. Sublimation of dry ice absorbs heat and cools the surrounding air.

8696. Thermal decomposition of calcium carbonate requires heat input and is endothermic.

8697. Thermal decomposition of copper carbonate needs heat and causes a temperature drop in the reacting zone if heat is not continuously supplied.

8698. Electrolysis of water requires energy input and behaves as an endothermic process.

8699. Photosynthesis absorbs energy from light and is an endothermic chemical process.

8700. Steam reforming of methane requires strong heat input and is endothermic.

8701. Dissolving ammonium nitrate in water absorbs heat, so the temperature of the mixture decreases.

8702. Dissolving potassium nitrate in water absorbs heat from the surroundings and causes cooling.

8703. Dissolving ammonium chloride in water is endothermic and makes the solution colder.

8704. Evaporation of water from a surface absorbs heat and lowers the surface temperature.

8705. Evaporation of ethanol absorbs heat from the surroundings and creates cooling.

8706. Melting ice absorbs heat and reduces the temperature of nearby materials.

8707. Sublimation of dry ice absorbs heat and cools the surrounding air.

8708. Thermal decomposition of calcium carbonate requires heat input and is endothermic.

8709. Thermal decomposition of copper carbonate needs heat and causes a temperature drop in the reacting zone if heat is not continuously supplied.

8710. Electrolysis of water requires energy input and behaves as an endothermic process.

8711. Photosynthesis absorbs energy from light and is an endothermic chemical process.

8712. Steam reforming of methane requires strong heat input and is endothermic.

8713. Dissolving ammonium nitrate in water absorbs heat, so the temperature of the mixture decreases.

8758. Electrolysis of water requires energy input and behaves as an endothermic process.

8759. Photosynthesis absorbs energy from light and is an endothermic chemical process.

8760. Steam reforming of methane requires strong heat input and is endothermic.

8761. Dissolving ammonium nitrate in water absorbs heat, so the temperature of the mixture decreases.

8762. Dissolving potassium nitrate in water absorbs heat from the surroundings and causes cooling.

8763. Dissolving ammonium chloride in water is endothermic and makes the solution colder.

8764. Evaporation of water from a surface absorbs heat and lowers the surface temperature.

8765. Evaporation of ethanol absorbs heat from the surroundings and creates cooling.

8766. Melting ice absorbs heat and reduces the temperature of nearby materials.

8767. Sublimation of dry ice absorbs heat and cools the surrounding air.

8768. Thermal decomposition of calcium carbonate requires heat input and is endothermic.

8769. Thermal decomposition of copper carbonate needs heat and causes a temperature drop in the reacting zone if heat is not continuously supplied.

8770. Electrolysis of water requires energy input and behaves as an endothermic process.

8771. Photosynthesis absorbs energy from light and is an endothermic chemical process.

8772. Steam reforming of methane requires strong heat input and is endothermic.

8773. Dissolving ammonium nitrate in water absorbs heat, so the temperature of the mixture decreases.

8774. Dissolving potassium nitrate in water absorbs heat from the surroundings and causes cooling.

8775. Dissolving ammonium chloride in water is endothermic and makes the solution colder.

8776. Evaporation of water from a surface absorbs heat and lowers the surface temperature.

8777. Evaporation of ethanol absorbs heat from the surroundings and creates cooling.

8778. Melting ice absorbs heat and reduces the temperature of nearby materials.

8779. Sublimation of dry ice absorbs heat and cools the surrounding air.

8780. Thermal decomposition of calcium carbonate requires heat input and is endothermic.

8781. Thermal decomposition of copper carbonate needs heat and causes a temperature drop in the reacting zone if heat is not continuously supplied.

8782. Electrolysis of water requires energy input and behaves as an endothermic process.

8783. Photosynthesis absorbs energy from light and is an endothermic chemical process.

8784. Steam reforming of methane requires strong heat input and is endothermic.

8785. Dissolving ammonium nitrate in water absorbs heat, so the temperature of the mixture decreases.

8786. Dissolving potassium nitrate in water absorbs heat from the surroundings and causes cooling.

8787. Dissolving ammonium chloride in water is endothermic and makes the solution colder.

8788. Evaporation of water from a surface absorbs heat and lowers the surface temperature.

8789. Evaporation of ethanol absorbs heat from the surroundings and creates cooling.

8790. Melting ice absorbs heat and reduces the temperature of nearby materials.

8791. Sublimation of dry ice absorbs heat and cools the surrounding air.

8792. Thermal decomposition of calcium carbonate requires heat input and is endothermic.

8793. Thermal decomposition of copper carbonate needs heat and causes a temperature drop in the reacting zone if heat is not continuously supplied.

8794. Electrolysis of water requires energy input and behaves as an endothermic process.

8795. Photosynthesis absorbs energy from light and is an endothermic chemical process.

8796. Steam reforming of methane requires strong heat input and is endothermic.

8797. Dissolving ammonium nitrate in water absorbs heat, so the temperature of the mixture decreases.

8798. Dissolving potassium nitrate in water absorbs heat from the surroundings and causes cooling.

8799. Dissolving ammonium chloride in water is endothermic and makes the solution colder.

8800. Evaporation of water from a surface absorbs heat and lowers the surface temperature.

8801. Evaporation of ethanol absorbs heat from the surroundings and creates cooling.

8934. Melting ice absorbs heat and reduces the temperature of nearby materials.

8935. Sublimation of dry ice absorbs heat and cools the surrounding air.

8936. Thermal decomposition of calcium carbonate requires heat input and is endothermic.

8937. Thermal decomposition of copper carbonate needs heat and causes a temperature drop in the reacting zone if heat is not continuously supplied.

8938. Electrolysis of water requires energy input and behaves as an endothermic process.

8939. Photosynthesis absorbs energy from light and is an endothermic chemical process.

8940. Steam reforming of methane requires strong heat input and is endothermic.

8941. Dissolving ammonium nitrate in water absorbs heat, so the temperature of the mixture decreases.

8942. Dissolving potassium nitrate in water absorbs heat from the surroundings and causes cooling.

8943. Dissolving ammonium chloride in water is endothermic and makes the solution colder.

8944. Evaporation of water from a surface absorbs heat and lowers the surface temperature.

8945. Evaporation of ethanol absorbs heat from the surroundings and creates cooling.

8946. Melting ice absorbs heat and reduces the temperature of nearby materials.

8947. Sublimation of dry ice absorbs heat and cools the surrounding air.

8948. Thermal decomposition of calcium carbonate requires heat input and is endothermic.

8949. Thermal decomposition of copper carbonate needs heat and causes a temperature drop in the reacting zone if heat is not continuously supplied.

8950. Electrolysis of water requires energy input and behaves as an endothermic process.

8951. Photosynthesis absorbs energy from light and is an endothermic chemical process.

8952. Steam reforming of methane requires strong heat input and is endothermic.

8953. Dissolving ammonium nitrate in water absorbs heat, so the temperature of the mixture decreases.

8954. Dissolving potassium nitrate in water absorbs heat from the surroundings and causes cooling.

8955. Dissolving ammonium chloride in water is endothermic and makes the solution colder.

8956. Evaporation of water from a surface absorbs heat and lowers the surface temperature.

8957. Evaporation of ethanol absorbs heat from the surroundings and creates cooling.

8958. Melting ice absorbs heat and reduces the temperature of nearby materials.

8959. Sublimation of dry ice absorbs heat and cools the surrounding air.

8960. Thermal decomposition of calcium carbonate requires heat input and is endothermic.

8961. Thermal decomposition of copper carbonate needs heat and causes a temperature drop in the reacting zone if heat is not continuously supplied.

8962. Electrolysis of water requires energy input and behaves as an endothermic process.

8963. Photosynthesis absorbs energy from light and is an endothermic chemical process.

8964. Steam reforming of methane requires strong heat input and is endothermic.

8965. Dissolving ammonium nitrate in water absorbs heat, so the temperature of the mixture decreases.

8966. Dissolving potassium nitrate in water absorbs heat from the surroundings and causes cooling.

8967. Dissolving ammonium chloride in water is endothermic and makes the solution colder.

8968. Evaporation of water from a surface absorbs heat and lowers the surface temperature.

8969. Evaporation of ethanol absorbs heat from the surroundings and creates cooling.

8970. Melting ice absorbs heat and reduces the temperature of nearby materials.

8971. Sublimation of dry ice absorbs heat and cools the surrounding air.

8972. Thermal decomposition of calcium carbonate requires heat input and is endothermic.

8973. Thermal decomposition of copper carbonate needs heat and causes a temperature drop in the reacting zone if heat is not continuously supplied.

8974. Electrolysis of water requires energy input and behaves as an endothermic process.

8975. Photosynthesis absorbs energy from light and is an endothermic chemical process.

8976. Steam reforming of methane requires strong heat input and is endothermic.

8977. Dissolving ammonium nitrate in water absorbs heat, so the temperature of the mixture decreases.

9022. Electrolysis of water requires energy input and behaves as an endothermic process.

9023. Photosynthesis absorbs energy from light and is an endothermic chemical process.

9024. Steam reforming of methane requires strong heat input and is endothermic.

9025. Dissolving ammonium nitrate in water absorbs heat, so the temperature of the mixture decreases.

9026. Dissolving potassium nitrate in water absorbs heat from the surroundings and causes cooling.

9027. Dissolving ammonium chloride in water is endothermic and makes the solution colder.

9028. Evaporation of water from a surface absorbs heat and lowers the surface temperature.

9029. Evaporation of ethanol absorbs heat from the surroundings and creates cooling.

9030. Melting ice absorbs heat and reduces the temperature of nearby materials.

9031. Sublimation of dry ice absorbs heat and cools the surrounding air.

9032. Thermal decomposition of calcium carbonate requires heat input and is endothermic.

9033. Thermal decomposition of copper carbonate needs heat and causes a temperature drop in the reacting zone if heat is not continuously supplied.

9034. Electrolysis of water requires energy input and behaves as an endothermic process.

9035. Photosynthesis absorbs energy from light and is an endothermic chemical process.

9036. Steam reforming of methane requires strong heat input and is endothermic.

9037. Dissolving ammonium nitrate in water absorbs heat, so the temperature of the mixture decreases.

9038. Dissolving potassium nitrate in water absorbs heat from the surroundings and causes cooling.

9039. Dissolving ammonium chloride in water is endothermic and makes the solution colder.

9040. Evaporation of water from a surface absorbs heat and lowers the surface temperature.

9041. Evaporation of ethanol absorbs heat from the surroundings and creates cooling.

9042. Melting ice absorbs heat and reduces the temperature of nearby materials.

9043. Sublimation of dry ice absorbs heat and cools the surrounding air.

9044. Thermal decomposition of calcium carbonate requires heat input and is endothermic.

9045. Thermal decomposition of copper carbonate needs heat and causes a temperature drop in the reacting zone if heat is not continuously supplied.

9046. Electrolysis of water requires energy input and behaves as an endothermic process.

9047. Photosynthesis absorbs energy from light and is an endothermic chemical process.

9048. Steam reforming of methane requires strong heat input and is endothermic.

9049. Dissolving ammonium nitrate in water absorbs heat, so the temperature of the mixture decreases.

9050. Dissolving potassium nitrate in water absorbs heat from the surroundings and causes cooling.

9051. Dissolving ammonium chloride in water is endothermic and makes the solution colder.

9052. Evaporation of water from a surface absorbs heat and lowers the surface temperature.

9053. Evaporation of ethanol absorbs heat from the surroundings and creates cooling.

9054. Melting ice absorbs heat and reduces the temperature of nearby materials.

9055. Sublimation of dry ice absorbs heat and cools the surrounding air.

9056. Thermal decomposition of calcium carbonate requires heat input and is endothermic.

9057. Thermal decomposition of copper carbonate needs heat and causes a temperature drop in the reacting zone if heat is not continuously supplied.

9058. Electrolysis of water requires energy input and behaves as an endothermic process.

9059. Photosynthesis absorbs energy from light and is an endothermic chemical process.

9060. Steam reforming of methane requires strong heat input and is endothermic.

9061. Dissolving ammonium nitrate in water absorbs heat, so the temperature of the mixture decreases.

9062. Dissolving potassium nitrate in water absorbs heat from the surroundings and causes cooling.

9063. Dissolving ammonium chloride in water is endothermic and makes the solution colder.

9064. Evaporation of water from a surface absorbs heat and lowers the surface temperature.

9065. Evaporation of ethanol absorbs heat from the surroundings and creates cooling.

9638. Dissolving potassium nitrate in water absorbs heat from the surroundings and causes cooling.

9639. Dissolving ammonium chloride in water is endothermic and makes the solution colder.

9640. Evaporation of water from a surface absorbs heat and lowers the surface temperature.

9641. Evaporation of ethanol absorbs heat from the surroundings and creates cooling.

9642. Melting ice absorbs heat and reduces the temperature of nearby materials.

9643. Sublimation of dry ice absorbs heat and cools the surrounding air.

9644. Thermal decomposition of calcium carbonate requires heat input and is endothermic.

9645. Thermal decomposition of copper carbonate needs heat and causes a temperature drop in the reacting zone if heat is not continuously supplied.

9646. Electrolysis of water requires energy input and behaves as an endothermic process.

9647. Photosynthesis absorbs energy from light and is an endothermic chemical process.

9648. Steam reforming of methane requires strong heat input and is endothermic.

9649. Dissolving ammonium nitrate in water absorbs heat, so the temperature of the mixture decreases.

9650. Dissolving potassium nitrate in water absorbs heat from the surroundings and causes cooling.

9651. Dissolving ammonium chloride in water is endothermic and makes the solution colder.

9652. Evaporation of water from a surface absorbs heat and lowers the surface temperature.

9653. Evaporation of ethanol absorbs heat from the surroundings and creates cooling.

9654. Melting ice absorbs heat and reduces the temperature of nearby materials.

9655. Sublimation of dry ice absorbs heat and cools the surrounding air.

9656. Thermal decomposition of calcium carbonate requires heat input and is endothermic.

9657. Thermal decomposition of copper carbonate needs heat and causes a temperature drop in the reacting zone if heat is not continuously supplied.

9658. Electrolysis of water requires energy input and behaves as an endothermic process.

9659. Photosynthesis absorbs energy from light and is an endothermic chemical process.

9660. Steam reforming of methane requires strong heat input and is endothermic.

9661. Dissolving ammonium nitrate in water absorbs heat, so the temperature of the mixture decreases.

9662. Dissolving potassium nitrate in water absorbs heat from the surroundings and causes cooling.

9663. Dissolving ammonium chloride in water is endothermic and makes the solution colder.

9664. Evaporation of water from a surface absorbs heat and lowers the surface temperature.

9665. Evaporation of ethanol absorbs heat from the surroundings and creates cooling.

9666. Melting ice absorbs heat and reduces the temperature of nearby materials.

9667. Sublimation of dry ice absorbs heat and cools the surrounding air.

9668. Thermal decomposition of calcium carbonate requires heat input and is endothermic.

9669. Thermal decomposition of copper carbonate needs heat and causes a temperature drop in the reacting zone if heat is not continuously supplied.

9670. Electrolysis of water requires energy input and behaves as an endothermic process.

9671. Photosynthesis absorbs energy from light and is an endothermic chemical process.

9672. Steam reforming of methane requires strong heat input and is endothermic.

9673. Dissolving ammonium nitrate in water absorbs heat, so the temperature of the mixture decreases.

9674. Dissolving potassium nitrate in water absorbs heat from the surroundings and causes cooling.

9675. Dissolving ammonium chloride in water is endothermic and makes the solution colder.

9676. Evaporation of water from a surface absorbs heat and lowers the surface temperature.

9677. Evaporation of ethanol absorbs heat from the surroundings and creates cooling.

9678. Melting ice absorbs heat and reduces the temperature of nearby materials.

9679. Sublimation of dry ice absorbs heat and cools the surrounding air.

9680. Thermal decomposition of calcium carbonate requires heat input and is endothermic.

9681. Thermal decomposition of copper carbonate needs heat and causes a temperature drop in the reacting zone if heat is not continuously supplied.

9946. Electrolysis of water requires energy input and behaves as an endothermic process.

9947. Photosynthesis absorbs energy from light and is an endothermic chemical process.

9948. Steam reforming of methane requires strong heat input and is endothermic.

9949. Dissolving ammonium nitrate in water absorbs heat, so the temperature of the mixture decreases.

9950. Dissolving potassium nitrate in water absorbs heat from the surroundings and causes cooling.

9951. Dissolving ammonium chloride in water is endothermic and makes the solution colder.

9952. Evaporation of water from a surface absorbs heat and lowers the surface temperature.

9953. Evaporation of ethanol absorbs heat from the surroundings and creates cooling.

9954. Melting ice absorbs heat and reduces the temperature of nearby materials.

9955. Sublimation of dry ice absorbs heat and cools the surrounding air.

9956. Thermal decomposition of calcium carbonate requires heat input and is endothermic.

9957. Thermal decomposition of copper carbonate needs heat and causes a temperature drop in the reacting zone if heat is not continuously supplied.

9958. Electrolysis of water requires energy input and behaves as an endothermic process.

9959. Photosynthesis absorbs energy from light and is an endothermic chemical process.

9960. Steam reforming of methane requires strong heat input and is endothermic.

9961. Dissolving ammonium nitrate in water absorbs heat, so the temperature of the mixture decreases.

9962. Dissolving potassium nitrate in water absorbs heat from the surroundings and causes cooling.

9963. Dissolving ammonium chloride in water is endothermic and makes the solution colder.

9964. Evaporation of water from a surface absorbs heat and lowers the surface temperature.

9965. Evaporation of ethanol absorbs heat from the surroundings and creates cooling.

9966. Melting ice absorbs heat and reduces the temperature of nearby materials.

9967. Sublimation of dry ice absorbs heat and cools the surrounding air.

9968. Thermal decomposition of calcium carbonate requires heat input and is endothermic.

9969. Thermal decomposition of copper carbonate needs heat and causes a temperature drop in the reacting zone if heat is not continuously supplied.

9970. Electrolysis of water requires energy input and behaves as an endothermic process.

9971. Photosynthesis absorbs energy from light and is an endothermic chemical process.

9972. Steam reforming of methane requires strong heat input and is endothermic.

9973. Dissolving ammonium nitrate in water absorbs heat, so the temperature of the mixture decreases.

9974. Dissolving potassium nitrate in water absorbs heat from the surroundings and causes cooling.

9975. Dissolving ammonium chloride in water is endothermic and makes the solution colder.

9976. Evaporation of water from a surface absorbs heat and lowers the surface temperature.

9977. Evaporation of ethanol absorbs heat from the surroundings and creates cooling.

9978. Melting ice absorbs heat and reduces the temperature of nearby materials.

9979. Sublimation of dry ice absorbs heat and cools the surrounding air.

9980. Thermal decomposition of calcium carbonate requires heat input and is endothermic.

9981. Thermal decomposition of copper carbonate needs heat and causes a temperature drop in the reacting zone if heat is not continuously supplied.

9982. Electrolysis of water requires energy input and behaves as an endothermic process.

9983. Photosynthesis absorbs energy from light and is an endothermic chemical process.

9984. Steam reforming of methane requires strong heat input and is endothermic.

9985. Dissolving ammonium nitrate in water absorbs heat, so the temperature of the mixture decreases.

9986. Dissolving potassium nitrate in water absorbs heat from the surroundings and causes cooling.

9987. Dissolving ammonium chloride in water is endothermic and makes the solution colder.

9988. Evaporation of water from a surface absorbs heat and lowers the surface temperature.

9989. Evaporation of ethanol absorbs heat from the surroundings and creates cooling.

9990. Melting ice absorbs heat and reduces the temperature of nearby materials.

9991. Sublimation of dry ice absorbs heat and cools the surrounding air.

9992. Thermal decomposition of calcium carbonate requires heat input and is endothermic.

9993. Thermal decomposition of copper carbonate needs heat and causes a temperature drop in the reacting zone if heat is not continuously supplied.

9994. Electrolysis of water requires energy input and behaves as an endothermic process.

9995. Photosynthesis absorbs energy from light and is an endothermic chemical process.

9996. Steam reforming of methane requires strong heat input and is endothermic.

9997. Dissolving ammonium nitrate in water absorbs heat, so the temperature of the mixture decreases.

9998. Dissolving potassium nitrate in water absorbs heat from the surroundings and causes cooling.

9999. Dissolving ammonium chloride in water is endothermic and makes the solution colder.

10000. Evaporation of water from a surface absorbs heat and lowers the surface temperature.

10001. Evaporation of ethanol absorbs heat from the surroundings and creates cooling.

10002. Melting ice absorbs heat and reduces the temperature of nearby materials.

10003. Sublimation of dry ice absorbs heat and cools the surrounding air.

10004. Thermal decomposition of calcium carbonate requires heat input and is endothermic.

10005. Thermal decomposition of copper carbonate needs heat and causes a temperature drop in the reacting zone if heat is not continuously supplied.

10006. Electrolysis of water requires energy input and behaves as an endothermic process.

10007. Photosynthesis absorbs energy from light and is an endothermic chemical process.

10008. Steam reforming of methane requires strong heat input and is endothermic.

10009. Dissolving ammonium nitrate in water absorbs heat, so the temperature of the mixture decreases.

10010. Dissolving potassium nitrate in water absorbs heat from the surroundings and causes cooling.

10011. Dissolving ammonium chloride in water is endothermic and makes the solution colder.

10012. Evaporation of water from a surface absorbs heat and lowers the surface temperature.

10013. Evaporation of ethanol absorbs heat from the surroundings and creates cooling.

10014. Melting ice absorbs heat and reduces the temperature of nearby materials.

10015. Sublimation of dry ice absorbs heat and cools the surrounding air.

10016. Thermal decomposition of calcium carbonate requires heat input and is endothermic.

10017. Thermal decomposition of copper carbonate needs heat and causes a temperature drop in the reacting zone if heat is not continuously supplied.

10018. Electrolysis of water requires energy input and behaves as an endothermic process.

10019. Photosynthesis absorbs energy from light and is an endothermic chemical process.

10020. Steam reforming of methane requires strong heat input and is endothermic.

10021. Dissolving ammonium nitrate in water absorbs heat, so the temperature of the mixture decreases.

10022. Dissolving potassium nitrate in water absorbs heat from the surroundings and causes cooling.

10023. Dissolving ammonium chloride in water is endothermic and makes the solution colder.

10024. Evaporation of water from a surface absorbs heat and lowers the surface temperature.

10025. Evaporation of ethanol absorbs heat from the surroundings and creates cooling.

10026. Melting ice absorbs heat and reduces the temperature of nearby materials.

10027. Sublimation of dry ice absorbs heat and cools the surrounding air.

10028. Thermal decomposition of calcium carbonate requires heat input and is endothermic.

10029. Thermal decomposition of copper carbonate needs heat and causes a temperature drop in the reacting zone if heat is not continuously supplied.

10030. Electrolysis of water requires energy input and behaves as an endothermic process.

10031. Photosynthesis absorbs energy from light and is an endothermic chemical process.

10032. Steam reforming of methane requires strong heat input and is endothermic.

10033. Dissolving ammonium nitrate in water absorbs heat, so the temperature of the mixture decreases.

186658. Electrolysis of water requires energy input and behaves as an endothermic process.

186659. Photosynthesis absorbs energy from light and is an endothermic chemical process.

186660. Steam reforming of methane requires strong heat input and is endothermic.

186661. Dissolving ammonium nitrate in water absorbs heat, so the temperature of the mixture decreases.

186662. Dissolving potassium nitrate in water absorbs heat from the surroundings and causes cooling.

186663. Dissolving ammonium chloride in water is endothermic and makes the solution colder.

186664. Evaporation of water from a surface absorbs heat and lowers the surface temperature.

186665. Evaporation of ethanol absorbs heat from the surroundings and creates cooling.

186666. Melting ice absorbs heat and reduces the temperature of nearby materials.

186667. Sublimation of dry ice absorbs heat and cools the surrounding air.

186668. Thermal decomposition of calcium carbonate requires heat input and is endothermic.

186669. Thermal decomposition of copper carbonate needs heat and causes a temperature drop in the reacting zone if heat is not continuously supplied.

186670. Electrolysis of water requires energy input and behaves as an endothermic process.

186671. Photosynthesis absorbs energy from light and is an endothermic chemical process.

186672. Steam reforming of methane requires strong heat input and is endothermic.

186673. Dissolving ammonium nitrate in water absorbs heat, so the temperature of the mixture decreases.

186674. Dissolving potassium nitrate in water absorbs heat from the surroundings and causes cooling.

186675. Dissolving ammonium chloride in water is endothermic and makes the solution colder.

186676. Evaporation of water from a surface absorbs heat and lowers the surface temperature.

186677. Evaporation of ethanol absorbs heat from the surroundings and creates cooling.

186678. Melting ice absorbs heat and reduces the temperature of nearby materials.

186679. Sublimation of dry ice absorbs heat and cools the surrounding air.

186680. Thermal decomposition of calcium carbonate requires heat input and is endothermic.

186681. Thermal decomposition of copper carbonate needs heat and causes a temperature drop in the reacting zone if heat is not continuously supplied.

186682. Electrolysis of water requires energy input and behaves as an endothermic process.

186683. Photosynthesis absorbs energy from light and is an endothermic chemical process.

186684. Steam reforming of methane requires strong heat input and is endothermic.

186685. Dissolving ammonium nitrate in water absorbs heat, so the temperature of the mixture decreases.

186686. Dissolving potassium nitrate in water absorbs heat from the surroundings and causes cooling.

186687. Dissolving ammonium chloride in water is endothermic and makes the solution colder.

186688. Evaporation of water from a surface absorbs heat and lowers the surface temperature.

186689. Evaporation of ethanol absorbs heat from the surroundings and creates cooling.

186690. Melting ice absorbs heat and reduces the temperature of nearby materials.

186691. Sublimation of dry ice absorbs heat and cools the surrounding air.

186692. Thermal decomposition of calcium carbonate requires heat input and is endothermic.

186693. Thermal decomposition of copper carbonate needs heat and causes a temperature drop in the reacting zone if heat is not continuously supplied.

186694. Electrolysis of water requires energy input and behaves as an endothermic process.

186695. Photosynthesis absorbs energy from light and is an endothermic chemical process.

186696. Steam reforming of methane requires strong heat input and is endothermic.

186697. Dissolving ammonium nitrate in water absorbs heat, so the temperature of the mixture decreases.

186698. Dissolving potassium nitrate in water absorbs heat from the surroundings and causes cooling.

186699. Dissolving ammonium chloride in water is endothermic and makes the solution colder.

18700. Evaporation of water from a surface absorbs heat and lowers the surface temperature.

18701. Evaporation of ethanol absorbs heat from the surroundings and creates cooling.

18702. Melting ice absorbs heat and reduces the temperature of nearby materials.

18703. Sublimation of dry ice absorbs heat and cools the surrounding air.

18704. Thermal decomposition of calcium carbonate requires heat input and is endothermic.

18705. Thermal decomposition of copper carbonate needs heat and causes a temperature drop in the reacting zone if heat is not continuously supplied.

18706. Electrolysis of water requires energy input and behaves as an endothermic process.

18707. Photosynthesis absorbs energy from light and is an endothermic chemical process.

18708. Steam reforming of methane requires strong heat input and is endothermic.

18709. Dissolving ammonium nitrate in water absorbs heat, so the temperature of the mixture decreases.

18710. Dissolving potassium nitrate in water absorbs heat from the surroundings and causes cooling.

18711. Dissolving ammonium chloride in water is endothermic and makes the solution colder.

18712. Evaporation of water from a surface absorbs heat and lowers the surface temperature.

18713. Evaporation of ethanol absorbs heat from the surroundings and creates cooling.

18714. Melting ice absorbs heat and reduces the temperature of nearby materials.

18715. Sublimation of dry ice absorbs heat and cools the surrounding air.

18716. Thermal decomposition of calcium carbonate requires heat input and is endothermic.

18717. Thermal decomposition of copper carbonate needs heat and causes a temperature drop in the reacting zone if heat is not continuously supplied.

18718. Electrolysis of water requires energy input and behaves as an endothermic process.

18719. Photosynthesis absorbs energy from light and is an endothermic chemical process.

18720. Steam reforming of methane requires strong heat input and is endothermic.

18721. Dissolving ammonium nitrate in water absorbs heat, so the temperature of the mixture decreases.

18722. Dissolving potassium nitrate in water absorbs heat from the surroundings and causes cooling.

18723. Dissolving ammonium chloride in water is endothermic and makes the solution colder.

18724. Evaporation of water from a surface absorbs heat and lowers the surface temperature.

18725. Evaporation of ethanol absorbs heat from the surroundings and creates cooling.

18726. Melting ice absorbs heat and reduces the temperature of nearby materials.

18727. Sublimation of dry ice absorbs heat and cools the surrounding air.

18728. Thermal decomposition of calcium carbonate requires heat input and is endothermic.

18729. Thermal decomposition of copper carbonate needs heat and causes a temperature drop in the reacting zone if heat is not continuously supplied.

18730. Electrolysis of water requires energy input and behaves as an endothermic process.

18731. Photosynthesis absorbs energy from light and is an endothermic chemical process.

18732. Steam reforming of methane requires strong heat input and is endothermic.

18733. Dissolving ammonium nitrate in water absorbs heat, so the temperature of the mixture decreases.

18734. Dissolving potassium nitrate in water absorbs heat from the surroundings and causes cooling.

18735. Dissolving ammonium chloride in water is endothermic and makes the solution colder.

18736. Evaporation of water from a surface absorbs heat and lowers the surface temperature.

18737. Evaporation of ethanol absorbs heat from the surroundings and creates cooling.

18738. Melting ice absorbs heat and reduces the temperature of nearby materials.

18739. Sublimation of dry ice absorbs heat and cools the surrounding air.

18740. Thermal decomposition of calcium carbonate requires heat input and is endothermic.

18741. Thermal decomposition of copper carbonate needs heat and causes a temperature drop in the reacting zone if heat is not continuously supplied.

18742. Electrolysis of water requires energy input and behaves as an endothermic process.

18743. Photosynthesis absorbs energy from light and is an endothermic chemical process.

18744. Steam reforming of methane requires strong heat input and is endothermic.

18745. Dissolving ammonium nitrate in water absorbs heat, so the temperature of the mixture decreases.

22926. Melting ice absorbs heat and reduces the temperature of nearby materials.

22927. Sublimation of dry ice absorbs heat and cools the surrounding air.

22928. Thermal decomposition of calcium carbonate requires heat input and is endothermic.

22929. Thermal decomposition of copper carbonate needs heat and causes a temperature drop in the reacting zone if heat is not continuously supplied.

22930. Electrolysis of water requires energy input and behaves as an endothermic process.

22931. Photosynthesis absorbs energy from light and is an endothermic chemical process.

22932. Steam reforming of methane requires strong heat input and is endothermic.

22933. Dissolving ammonium nitrate in water absorbs heat, so the temperature of the mixture decreases.

22934. Dissolving potassium nitrate in water absorbs heat from the surroundings and causes cooling.

22935. Dissolving ammonium chloride in water is endothermic and makes the solution colder.

22936. Evaporation of water from a surface absorbs heat and lowers the surface temperature.

22937. Evaporation of ethanol absorbs heat from the surroundings and creates cooling.

22938. Melting ice absorbs heat and reduces the temperature of nearby materials.

22939. Sublimation of dry ice absorbs heat and cools the surrounding air.

22940. Thermal decomposition of calcium carbonate requires heat input and is endothermic.

22941. Thermal decomposition of copper carbonate needs heat and causes a temperature drop in the reacting zone if heat is not continuously supplied.

22942. Electrolysis of water requires energy input and behaves as an endothermic process.

22943. Photosynthesis absorbs energy from light and is an endothermic chemical process.

22944. Steam reforming of methane requires strong heat input and is endothermic.

22945. Dissolving ammonium nitrate in water absorbs heat, so the temperature of the mixture decreases.

22946. Dissolving potassium nitrate in water absorbs heat from the surroundings and causes cooling.

22947. Dissolving ammonium chloride in water is endothermic and makes the solution colder.

22948. Evaporation of water from a surface absorbs heat and lowers the surface temperature.

22949. Evaporation of ethanol absorbs heat from the surroundings and creates cooling.

22950. Melting ice absorbs heat and reduces the temperature of nearby materials.

22951. Sublimation of dry ice absorbs heat and cools the surrounding air.

22952. Thermal decomposition of calcium carbonate requires heat input and is endothermic.

22953. Thermal decomposition of copper carbonate needs heat and causes a temperature drop in the reacting zone if heat is not continuously supplied.

22954. Electrolysis of water requires energy input and behaves as an endothermic process.

22955. Photosynthesis absorbs energy from light and is an endothermic chemical process.

22956. Steam reforming of methane requires strong heat input and is endothermic.

22957. Dissolving ammonium nitrate in water absorbs heat, so the temperature of the mixture decreases.

22958. Dissolving potassium nitrate in water absorbs heat from the surroundings and causes cooling.

22959. Dissolving ammonium chloride in water is endothermic and makes the solution colder.

22960. Evaporation of water from a surface absorbs heat and lowers the surface temperature.

22961. Evaporation of ethanol absorbs heat from the surroundings and creates cooling.

22962. Melting ice absorbs heat and reduces the temperature of nearby materials.

22963. Sublimation of dry ice absorbs heat and cools the surrounding air.

22964. Thermal decomposition of calcium carbonate requires heat input and is endothermic.

22965. Thermal decomposition of copper carbonate needs heat and causes a temperature drop in the reacting zone if heat is not continuously supplied.

22966. Electrolysis of water requires energy input and behaves as an endothermic process.

22967. Photosynthesis absorbs energy from light and is an endothermic chemical process.

22968. Steam reforming of methane requires strong heat input and is endothermic.

22969. Dissolving ammonium nitrate in water absorbs heat, so the temperature of the mixture decreases.

29306. Dissolving potassium nitrate in water absorbs heat from the surroundings and causes cooling.

29307. Dissolving ammonium chloride in water is endothermic and makes the solution colder.

29308. Evaporation of water from a surface absorbs heat and lowers the surface temperature.

29309. Evaporation of ethanol absorbs heat from the surroundings and creates cooling.

29310. Melting ice absorbs heat and reduces the temperature of nearby materials.

29311. Sublimation of dry ice absorbs heat and cools the surrounding air.

29312. Thermal decomposition of calcium carbonate requires heat input and is endothermic.

29313. Thermal decomposition of copper carbonate needs heat and causes a temperature drop in the reacting zone if heat is not continuously supplied.

29314. Electrolysis of water requires energy input and behaves as an endothermic process.

29315. Photosynthesis absorbs energy from light and is an endothermic chemical process.

29316. Steam reforming of methane requires strong heat input and is endothermic.

29317. Dissolving ammonium nitrate in water absorbs heat, so the temperature of the mixture decreases.

29318. Dissolving potassium nitrate in water absorbs heat from the surroundings and causes cooling.

29319. Dissolving ammonium chloride in water is endothermic and makes the solution colder.

29320. Evaporation of water from a surface absorbs heat and lowers the surface temperature.

29321. Evaporation of ethanol absorbs heat from the surroundings and creates cooling.

29322. Melting ice absorbs heat and reduces the temperature of nearby materials.

29323. Sublimation of dry ice absorbs heat and cools the surrounding air.

29324. Thermal decomposition of calcium carbonate requires heat input and is endothermic.

29325. Thermal decomposition of copper carbonate needs heat and causes a temperature drop in the reacting zone if heat is not continuously supplied.

29326. Electrolysis of water requires energy input and behaves as an endothermic process.

29327. Photosynthesis absorbs energy from light and is an endothermic chemical process.

29328. Steam reforming of methane requires strong heat input and is endothermic.

29329. Dissolving ammonium nitrate in water absorbs heat, so the temperature of the mixture decreases.

29330. Dissolving potassium nitrate in water absorbs heat from the surroundings and causes cooling.

29331. Dissolving ammonium chloride in water is endothermic and makes the solution colder.

29332. Evaporation of water from a surface absorbs heat and lowers the surface temperature.

29333. Evaporation of ethanol absorbs heat from the surroundings and creates cooling.

29334. Melting ice absorbs heat and reduces the temperature of nearby materials.

29335. Sublimation of dry ice absorbs heat and cools the surrounding air.

29336. Thermal decomposition of calcium carbonate requires heat input and is endothermic.

29337. Thermal decomposition of copper carbonate needs heat and causes a temperature drop in the reacting zone if heat is not continuously supplied.

29338. Electrolysis of water requires energy input and behaves as an endothermic process.

29339. Photosynthesis absorbs energy from light and is an endothermic chemical process.

29340. Steam reforming of methane requires strong heat input and is endothermic.

29341. Dissolving ammonium nitrate in water absorbs heat, so the temperature of the mixture decreases.

29342. Dissolving potassium nitrate in water absorbs heat from the surroundings and causes cooling.

29343. Dissolving ammonium chloride in water is endothermic and makes the solution colder.

29344. Evaporation of water from a surface absorbs heat and lowers the surface temperature.

29345. Evaporation of ethanol absorbs heat from the surroundings and creates cooling.

29346. Melting ice absorbs heat and reduces the temperature of nearby materials.

29347. Sublimation of dry ice absorbs heat and cools the surrounding air.

29348. Thermal decomposition of calcium carbonate requires heat input and is endothermic.

29349. Thermal decomposition of copper carbonate needs heat and causes a temperature drop in the reacting zone if heat is not continuously supplied.

293350. Electrolysis of water requires energy input and behaves as an endothermic process.

293351. Photosynthesis absorbs energy from light and is an endothermic chemical process.

293352. Steam reforming of methane requires strong heat input and is endothermic.

293353. Dissolving ammonium nitrate in water absorbs heat, so the temperature of the mixture decreases.

293354. Dissolving potassium nitrate in water absorbs heat from the surroundings and causes cooling.

293355. Dissolving ammonium chloride in water is endothermic and makes the solution colder.

293356. Evaporation of water from a surface absorbs heat and lowers the surface temperature.

293357. Evaporation of ethanol absorbs heat from the surroundings and creates cooling.

293358. Melting ice absorbs heat and reduces the temperature of nearby materials.

293359. Sublimation of dry ice absorbs heat and cools the surrounding air.

293360. Thermal decomposition of calcium carbonate requires heat input and is endothermic.

293361. Thermal decomposition of copper carbonate needs heat and causes a temperature drop in the reacting zone if heat is not continuously supplied.

293362. Electrolysis of water requires energy input and behaves as an endothermic process.

293363. Photosynthesis absorbs energy from light and is an endothermic chemical process.

293364. Steam reforming of methane requires strong heat input and is endothermic.

293365. Dissolving ammonium nitrate in water absorbs heat, so the temperature of the mixture decreases.

293366. Dissolving potassium nitrate in water absorbs heat from the surroundings and causes cooling.

293367. Dissolving ammonium chloride in water is endothermic and makes the solution colder.

293368. Evaporation of water from a surface absorbs heat and lowers the surface temperature.

293369. Evaporation of ethanol absorbs heat from the surroundings and creates cooling.

293370. Melting ice absorbs heat and reduces the temperature of nearby materials.

293371. Sublimation of dry ice absorbs heat and cools the surrounding air.

293372. Thermal decomposition of calcium carbonate requires heat input and is endothermic.

293373. Thermal decomposition of copper carbonate needs heat and causes a temperature drop in the reacting zone if heat is not continuously supplied.

293374. Electrolysis of water requires energy input and behaves as an endothermic process.

293375. Photosynthesis absorbs energy from light and is an endothermic chemical process.

293376. Steam reforming of methane requires strong heat input and is endothermic.

293377. Dissolving ammonium nitrate in water absorbs heat, so the temperature of the mixture decreases.

293378. Dissolving potassium nitrate in water absorbs heat from the surroundings and causes cooling.

293379. Dissolving ammonium chloride in water is endothermic and makes the solution colder.

293380. Evaporation of water from a surface absorbs heat and lowers the surface temperature.

293381. Evaporation of ethanol absorbs heat from the surroundings and creates cooling.

293382. Melting ice absorbs heat and reduces the temperature of nearby materials.

293383. Sublimation of dry ice absorbs heat and cools the surrounding air.

293384. Thermal decomposition of calcium carbonate requires heat input and is endothermic.

293385. Thermal decomposition of copper carbonate needs heat and causes a temperature drop in the reacting zone if heat is not continuously supplied.

293386. Electrolysis of water requires energy input and behaves as an endothermic process.

293387. Photosynthesis absorbs energy from light and is an endothermic chemical process.

293388. Steam reforming of methane requires strong heat input and is endothermic.

293389. Dissolving ammonium nitrate in water absorbs heat, so the temperature of the mixture decreases.

293390. Dissolving potassium nitrate in water absorbs heat from the surroundings and causes cooling.

293391. Dissolving ammonium chloride in water is endothermic and makes the solution colder.

293392. Evaporation of water from a surface absorbs heat and lowers the surface temperature.

293393. Evaporation of ethanol absorbs heat from the surroundings and creates cooling.

29922. Melting ice absorbs heat and reduces the temperature of nearby materials.

29923. Sublimation of dry ice absorbs heat and cools the surrounding air.

29924. Thermal decomposition of calcium carbonate requires heat input and is endothermic.

29925. Thermal decomposition of copper carbonate needs heat and causes a temperature drop in the reacting zone if heat is not continuously supplied.

29926. Electrolysis of water requires energy input and behaves as an endothermic process.

29927. Photosynthesis absorbs energy from light and is an endothermic chemical process.

29928. Steam reforming of methane requires strong heat input and is endothermic.

29929. Dissolving ammonium nitrate in water absorbs heat, so the temperature of the mixture decreases.

29930. Dissolving potassium nitrate in water absorbs heat from the surroundings and causes cooling.

29931. Dissolving ammonium chloride in water is endothermic and makes the solution colder.

29932. Evaporation of water from a surface absorbs heat and lowers the surface temperature.

29933. Evaporation of ethanol absorbs heat from the surroundings and creates cooling.

29934. Melting ice absorbs heat and reduces the temperature of nearby materials.

29935. Sublimation of dry ice absorbs heat and cools the surrounding air.

29936. Thermal decomposition of calcium carbonate requires heat input and is endothermic.

29937. Thermal decomposition of copper carbonate needs heat and causes a temperature drop in the reacting zone if heat is not continuously supplied.

29938. Electrolysis of water requires energy input and behaves as an endothermic process.

29939. Photosynthesis absorbs energy from light and is an endothermic chemical process.

29940. Steam reforming of methane requires strong heat input and is endothermic.

29941. Dissolving ammonium nitrate in water absorbs heat, so the temperature of the mixture decreases.

29942. Dissolving potassium nitrate in water absorbs heat from the surroundings and causes cooling.

29943. Dissolving ammonium chloride in water is endothermic and makes the solution colder.

29944. Evaporation of water from a surface absorbs heat and lowers the surface temperature.

29945. Evaporation of ethanol absorbs heat from the surroundings and creates cooling.

29946. Melting ice absorbs heat and reduces the temperature of nearby materials.

29947. Sublimation of dry ice absorbs heat and cools the surrounding air.

29948. Thermal decomposition of calcium carbonate requires heat input and is endothermic.

29949. Thermal decomposition of copper carbonate needs heat and causes a temperature drop in the reacting zone if heat is not continuously supplied.

29950. Electrolysis of water requires energy input and behaves as an endothermic process.

29951. Photosynthesis absorbs energy from light and is an endothermic chemical process.

29952. Steam reforming of methane requires strong heat input and is endothermic.

29953. Dissolving ammonium nitrate in water absorbs heat, so the temperature of the mixture decreases.

29954. Dissolving potassium nitrate in water absorbs heat from the surroundings and causes cooling.

29955. Dissolving ammonium chloride in water is endothermic and makes the solution colder.

29956. Evaporation of water from a surface absorbs heat and lowers the surface temperature.

29957. Evaporation of ethanol absorbs heat from the surroundings and creates cooling.

29958. Melting ice absorbs heat and reduces the temperature of nearby materials.

29959. Sublimation of dry ice absorbs heat and cools the surrounding air.

29960. Thermal decomposition of calcium carbonate requires heat input and is endothermic.

29961. Thermal decomposition of copper carbonate needs heat and causes a temperature drop in the reacting zone if heat is not continuously supplied.

29962. Electrolysis of water requires energy input and behaves as an endothermic process.

29963. Photosynthesis absorbs energy from light and is an endothermic chemical process.

29964. Steam reforming of methane requires strong heat input and is endothermic.

29965. Dissolving ammonium nitrate in water absorbs heat, so the temperature of the mixture decreases.

29966. Dissolving potassium nitrate in water absorbs heat from the surroundings and causes cooling.

29967. Dissolving ammonium chloride in water is endothermic and makes the solution colder.

29968. Evaporation of water from a surface absorbs heat and lowers the surface temperature.

29969. Evaporation of ethanol absorbs heat from the surroundings and creates cooling.

29970. Melting ice absorbs heat and reduces the temperature of nearby materials.

29971. Sublimation of dry ice absorbs heat and cools the surrounding air.

29972. Thermal decomposition of calcium carbonate requires heat input and is endothermic.

29973. Thermal decomposition of copper carbonate needs heat and causes a temperature drop in the reacting zone if heat is not continuously supplied.

29974. Electrolysis of water requires energy input and behaves as an endothermic process.

29975. Photosynthesis absorbs energy from light and is an endothermic chemical process.

29976. Steam reforming of methane requires strong heat input and is endothermic.

29977. Dissolving ammonium nitrate in water absorbs heat, so the temperature of the mixture decreases.

29978. Dissolving potassium nitrate in water absorbs heat from the surroundings and causes cooling.

29979. Dissolving ammonium chloride in water is endothermic and makes the solution colder.

29980. Evaporation of water from a surface absorbs heat and lowers the surface temperature.

29981. Evaporation of ethanol absorbs heat from the surroundings and creates cooling.

29982. Melting ice absorbs heat and reduces the temperature of nearby materials.

29983. Sublimation of dry ice absorbs heat and cools the surrounding air.

29984. Thermal decomposition of calcium carbonate requires heat input and is endothermic.

29985. Thermal decomposition of copper carbonate needs heat and causes a temperature drop in the reacting zone if heat is not continuously supplied.

29986. Electrolysis of water requires energy input and behaves as an endothermic process.

29987. Photosynthesis absorbs energy from light and is an endothermic chemical process.

29988. Steam reforming of methane requires strong heat input and is endothermic.

29989. Dissolving ammonium nitrate in water absorbs heat, so the temperature of the mixture decreases.

29990. Dissolving potassium nitrate in water absorbs heat from the surroundings and causes cooling.

29991. Dissolving ammonium chloride in water is endothermic and makes the solution colder.

29992. Evaporation of water from a surface absorbs heat and lowers the surface temperature.

29993. Evaporation of ethanol absorbs heat from the surroundings and creates cooling.

29994. Melting ice absorbs heat and reduces the temperature of nearby materials.

29995. Sublimation of dry ice absorbs heat and cools the surrounding air.

29996. Thermal decomposition of calcium carbonate requires heat input and is endothermic.

29997. Thermal decomposition of copper carbonate needs heat and causes a temperature drop in the reacting zone if heat is not continuously supplied.

29998. Electrolysis of water requires energy input and behaves as an endothermic process.

29999. Photosynthesis absorbs energy from light and is an endothermic chemical process.

30000. Steam reforming of methane requires strong heat input and is endothermic.

400 Named Substances for App Library

Total listed: 400

Includes all elements plus acids, bases, salts, oxides, gases, organics, and lab materials.

- | | |
|------------------|------------------------|
| 1. Hydrogen | 67. Holmium |
| 2. Helium | 68. Erbium |
| 3. Lithium | 69. Thulium |
| 4. Beryllium | 70. Ytterbium |
| 5. Boron | 71. Lutetium |
| 6. Carbon | 72. Hafnium |
| 7. Nitrogen | 73. Tantalum |
| 8. Oxygen | 74. Tungsten |
| 9. Fluorine | 75. Rhenium |
| 10. Neon | 76. Osmium |
| 11. Sodium | 77. Iridium |
| 12. Magnesium | 78. Platinum |
| 13. Aluminium | 79. Gold |
| 14. Silicon | 80. Mercury |
| 15. Phosphorus | 81. Thallium |
| 16. Sulfur | 82. Lead |
| 17. Chlorine | 83. Bismuth |
| 18. Argon | 84. Polonium |
| 19. Potassium | 85. Astatine |
| 20. Calcium | 86. Radon |
| 21. Scandium | 87. Francium |
| 22. Titanium | 88. Radium |
| 23. Vanadium | 89. Actinium |
| 24. Chromium | 90. Thorium |
| 25. Manganese | 91. Protactinium |
| 26. Iron | 92. Uranium |
| 27. Cobalt | 93. Neptunium |
| 28. Nickel | 94. Plutonium |
| 29. Copper | 95. Americium |
| 30. Zinc | 96. Curium |
| 31. Gallium | 97. Berkelium |
| 32. Germanium | 98. Californium |
| 33. Arsenic | 99. Einsteinium |
| 34. Selenium | 100. Fermium |
| 35. Bromine | 101. Mendelevium |
| 36. Krypton | 102. Nobelium |
| 37. Rubidium | 103. Lawrencium |
| 38. Strontium | 104. Rutherfordium |
| 39. Yttrium | 105. Dubnium |
| 40. Zirconium | 106. Seaborgium |
| 41. Niobium | 107. Bohrium |
| 42. Molybdenum | 108. Hassium |
| 43. Technetium | 109. Meitnerium |
| 44. Ruthenium | 110. Darmstadtium |
| 45. Rhodium | 111. Roentgenium |
| 46. Palladium | 112. Copernicium |
| 47. Silver | 113. Nihonium |
| 48. Cadmium | 114. Flerovium |
| 49. Indium | 115. Moscovium |
| 50. Tin | 116. Livermorium |
| 51. Antimony | 117. Tennessine |
| 52. Tellurium | 118. Oganesson |
| 53. Iodine | 119. Hydrochloric acid |
| 54. Xenon | 120. Sulfuric acid |
| 55. Caesium | 121. Nitric acid |
| 56. Barium | 122. Acetic acid |
| 57. Lanthanum | 123. Phosphoric acid |
| 58. Cerium | 124. Carbonic acid |
| 59. Praseodymium | 125. Hydrofluoric acid |
| 60. Neodymium | 126. Hydrobromic acid |
| 61. Promethium | 127. Hydroiodic acid |
| 62. Samarium | 128. Perchloric acid |
| 63. Europium | 129. Chloric acid |
| 64. Gadolinium | 130. Chlorous acid |
| 65. Terbium | 131. Hypochlorous acid |
| 66. Dysprosium | 132. Boric acid |

133. Citric acid
134. Formic acid
135. Oxalic acid
136. Tartaric acid
137. Lactic acid
138. Benzoic acid
139. Sulfurous acid
140. Nitrous acid
141. Hydrosulfuric acid
142. Selenic acid
143. Selenous acid
144. Chromic acid
145. Dichromic acid
146. Permanganic acid
147. Hydrocyanic acid
148. Pyrophosphoric acid
149. Sodium hydroxide
150. Potassium hydroxide
151. Calcium hydroxide
152. Magnesium hydroxide
153. Barium hydroxide
154. Ammonium hydroxide
155. Lithium hydroxide
156. Strontium hydroxide
157. Aluminium hydroxide
158. Iron(II) hydroxide
159. Iron(III) hydroxide
160. Copper(II) hydroxide
161. Zinc hydroxide
162. Nickel(II) hydroxide
163. Cobalt(II) hydroxide
164. Lead(II) hydroxide
165. Tin(II) hydroxide
166. Chromium(III) hydroxide
167. Manganese(II) hydroxide
168. Silver hydroxide
169. Beryllium hydroxide
170. Cadmium hydroxide
171. Mercury(II) hydroxide
172. Rubidium hydroxide
173. Cesium hydroxide
174. Sodium carbonate solution
175. Potassium carbonate solution
176. Calcium oxide slurry
177. Magnesium oxide slurry
178. Aqueous ammonia
179. Sodium chloride
180. Potassium chloride
181. Calcium chloride
182. Magnesium chloride
183. Barium chloride
184. Ammonium chloride
185. Copper(II) chloride
186. Iron(III) chloride
187. Zinc chloride
188. Aluminium chloride
189. Silver nitrate
190. Potassium nitrate
191. Sodium nitrate
192. Calcium nitrate
193. Magnesium nitrate
194. Copper(II) nitrate
195. Zinc nitrate
196. Lead(II) nitrate
197. Barium nitrate
198. Ammonium nitrate
199. Sodium sulfate
200. Potassium sulfate
201. Magnesium sulfate
202. Copper(II) sulfate
203. Zinc sulfate
204. Iron(II) sulfate
205. Ammonium sulfate
206. Calcium sulfate
207. Barium sulfate
208. Sodium carbonate
209. Potassium carbonate
210. Calcium carbonate
211. Magnesium carbonate
212. Zinc carbonate
213. Copper carbonate
214. Sodium bicarbonate
215. Potassium bicarbonate
216. Ammonium bicarbonate
217. Sodium phosphate
218. Potassium phosphate
219. Calcium phosphate
220. Ammonium phosphate
221. Sodium sulfite
222. Sodium thiosulfate
223. Potassium permanganate
224. Potassium dichromate
225. Sodium acetate
226. Calcium acetate
227. Copper acetate
228. Silver chloride
229. Water
230. Hydrogen peroxide
231. Carbon monoxide
232. Carbon dioxide
233. Sulfur dioxide
234. Sulfur trioxide
235. Nitric oxide
236. Nitrogen dioxide
237. Dinitrogen pentoxide
238. Phosphorus pentoxide
239. Silicon dioxide
240. Magnesium oxide
241. Calcium oxide
242. Barium oxide
243. Aluminium oxide
244. Iron(II) oxide
245. Iron(III) oxide
246. Copper(I) oxide
247. Copper(II) oxide
248. Zinc oxide
249. Lead(II) oxide
250. Tin(II) oxide
251. Nickel(II) oxide
252. Cobalt(II) oxide
253. Manganese dioxide
254. Chromium(III) oxide
255. Titanium dioxide
256. Vanadium pentoxide
257. Sodium oxide
258. Potassium oxide
259. Hydrogen gas
260. Oxygen gas
261. Nitrogen gas
262. Chlorine gas
263. Fluorine gas
264. Bromine vapor
265. Iodine vapor
266. Ammonia gas
267. Hydrogen chloride gas
268. Hydrogen bromide gas
269. Hydrogen iodide gas
270. Sulfur dioxide gas
271. Sulfur trioxide gas
272. Carbon dioxide gas

273. Carbon monoxide gas	
274. Nitric oxide gas	
275. Nitrogen dioxide gas	
276. Nitrous oxide gas	
277. Methane gas	
278. Ethane gas	
279. Propane gas	
280. Butane gas	
281. Ethylene gas	347. Bleaching powder
282. Acetylene gas	348. Plaster of Paris
283. Ozone	349. Gypsum
284. Helium gas	350. Silica gel
285. Neon gas	351. Activated charcoal
286. Argon gas	352. Charcoal
287. Krypton gas	353. Coke
288. Xenon gas	354. Coal
289. Methanol	355. Graphite
290. Ethanol	356. Diamond
291. Propanol	357. Sand
292. Butanol	358. Clay
293. Ethylene glycol	359. Glass wool
294. Glycerol	360. Ceramic powder
295. Acetone	361. Sulfur powder
296. Propanone	362. Phosphorus powder
297. Acetaldehyde	363. Iron filings
298. Formaldehyde	364. Copper turnings
299. Glucose	365. Zinc granules
300. Fructose	366. Magnesium ribbon
301. Sucrose	367. Calcium metal
302. Starch	368. Sodium metal
303. Cellulose	369. Potassium metal
304. Urea	370. Lithium metal
305. Benzene	371. Aluminium foil
306. Toluene	372. Steel wool
307. Phenol	373. Rust
308. Aniline	374. Milk of magnesia
309. Acetamide	375. Vinegar
310. Formamide	376. Baking soda
311. Acetic anhydride	377. Washing soda
312. Ethyl acetate	378. Borax
313. Methyl acetate	379. Soap solution
314. Diethyl ether	380. Detergent solution
315. Petroleum ether	381. Starch indicator
316. Hexane	382. Litmus solution
317. Heptane	383. Phenolphthalein
318. Octane	384. Methyl orange
319. Cyclohexane	385. Universal indicator
320. Cyclohexanol	386. Iodine solution
321. Cyclohexanone	387. Bromine water
322. Acetic acid solution	388. Chlorine water
323. Citric acid solution	389. Ammonium chloride crystals
324. Lactic acid solution	390. Ammonium nitrate crystals
325. Formic acid solution	391. Copper sulfate crystals
326. Benzoic acid solution	392. Potassium nitrate crystals
327. Oxalic acid solution	393. Sodium nitrate crystals
328. Tartaric acid solution	394. Sodium chloride crystals
329. Sodium citrate	395. Calcium carbonate powder
330. Sodium benzoate	396. Marble chips
331. Sodium formate	397. Chalk
332. Calcium lactate	398. Limestone
333. Magnesium citrate	399. Quicklime
334. Copper gluconate	400. Slaked lime
335. Sodium alginate	
336. Agar	
337. Gelatin	
338. Paraffin wax	
339. Dry ice	
340. Ice	
341. Steam	
342. Distilled water	
343. Tap water	
344. Sea water	
345. Brine	
346. Lime water
